Abstract: *The concept of evaluating Brand Equity in the competitive healthcare industry where India is having highest benefit of being one of the most preferred healthcare destination, can bring great advantage to any healthcare organization. This study was aimed at evaluating the contribution of three components that is Perceived quality, Brand loyalty, and Brand image towards brand equity of a tertiary care super specialty teaching hospital .Perception of 150 patients /patient attendants was recorded by interviewing them using a validated questionnaire containing thirty three variables. Factor analysis of these variables led to identification of six sub dimensions under the three components of brand equity. These six dimensions being Physical Aspect, Staff Attribute, Switching Aspects, Loyalty Aspects, Value for Money, Brand Value contributed highly to brand equity of the hospital.*

Keywords: *Brand image, Brand loyalty, Factor Analysis, Perceived quality.*

I. Introduction

Branding is a valuable intangible asset for sustainable growth of an organization. Positive branding enables customers to visualize product in a positive way thereby reducing customers' perceived risks in buying any service. It also helps companies achieve superior performance in a competitive market. Brand equity is considered as the power of every brand that is incorporated in the mind of all the consumers on the basis of what they have learnt, seen, felt, and heard about the brand. Brand loyalty and brand equity satisfies customer needs; therefore study of brand equity gives an insight to gain a competitive advantage in business. In health care industry it is essential for the hospitals to be concerned about providing quality services, enabling consumers to continue preferring the services from the same healthcare organization, having positive influence in the mind of customer. Brand equity can be enhanced by increasing patients' benefits and doctors' independence.

II. Review Of Literature

Different authors have different concept linked with brand equity, Keller (1993) considers brand equity as brand knowledge that is, brand and brand image. Lassar et al. (1995), on the other hand, links it with five dimensions which are performance, value, social image, trustworthiness, and attachment. Service companies specially hospitals can build strong brands by performing the core services with quality, reaching all the customer emotionally, by linking their organization's brand with trust, Lemon et al.(2001).

Bitner and Hubbert (2011) studied the customers overall impression or assessment related to the relative superiority or inferiority of the organization & the services provided by them; customer's perception developed in the process of service delivery& then performed comparison of customer's perception to their expectations thus evaluating the outcomes of delivered service.

In case of healthcare environment, if consumers continue to opt for the services from the same healthcare firm (or a provider) then he is considered as a loyal consumer. Chahal and Bala (2010) describe service brand loyalty & repurchase behavior (behavioral loyalty) positive attitude (attitudinal loyalty) of consumers toward the hospital as synonyms. Boshoff and Gray (2004) stated that several studies advocated revisit intention as an indication for patient loyalty towards that healthcare organization. Further they described patient loyalty may be more appropriate viewed as a behavioral intention in case of hospitals. Hence, patient loyalty acts as a competitive asset for the hospital

Heerden 1995 stated that brand image is an important factor for service evaluation, taking example of a company having positive corporate image of its programs can bring in differentiation & individuality that results to high reputation, loyalty, and awareness and eventually resulting to attract consumers.

III. Research Methodology

This analytical study was based on analysis of primary data collected from patient /patient's attendant through scheduling in various General and Special ward of Hospital. The perception of patient and patient party was recorded by using validated questionnaire containing thirty three variables pertaining to three components

of brand equity. The entire process of data collection was very interactive. Sample size was calculated using Fischer’s formula & questionnaire was administered to 150 respondents for a period of 7 weeks. Proportionate sampling method was used considering the hospital bed statistics for obtaining sample size of various wards in hospital. Factor analysis was conducted for data interpretation, which was done using IBM SPSS statistic 21 software.

IV. Observation & Data Interpretation

The data analysis was made on a five point ranking scale (Likert –type scale) and objective type question in order to assess the perception of the customer that is patient/patient’s attendants. Figure shown below demonstrates the socio-demographics of the respondents.

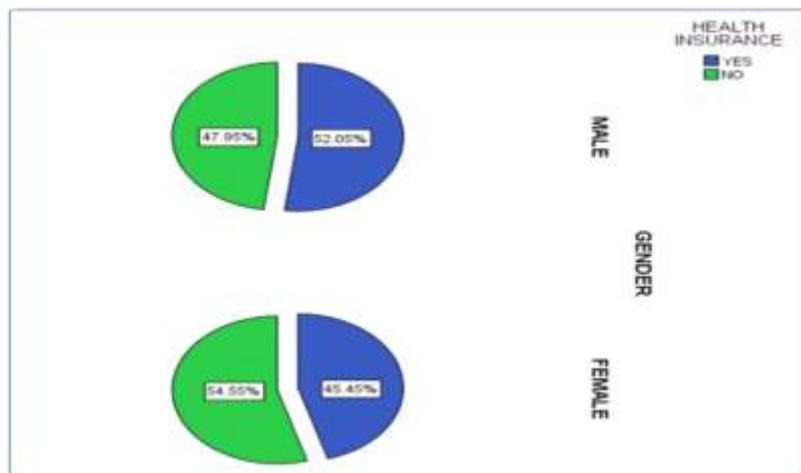

Figure1: Percentage of male and female respondent who availed health insurance

The Fig 1 above shows that fifty two percentage of male respondent have taken Health insurance and approximately forty-six percentages of women have taken health insurance.

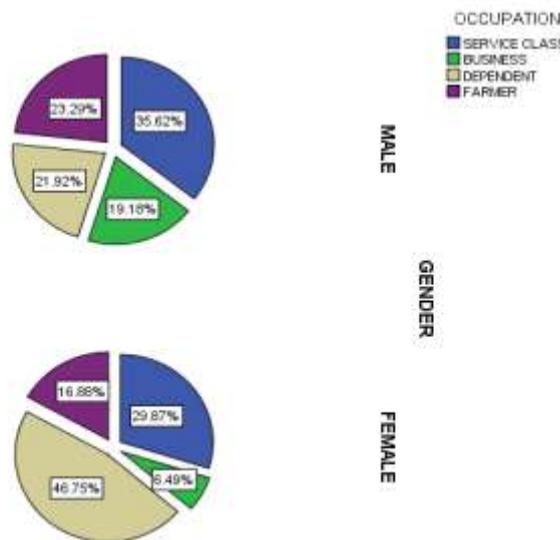

Figure 2: Percentage of occupation of male and female respondent

The Fig 2 demonstrates the occupation of male and female respondent. Amongst male respondent around thirty-six percent work at service class level, followed by farmers with twenty three percentage and twenty two percentage respectively and only nineteen percent were farmers. Among female respondent, forty seven percentage are dependent, followed by service class employment with approximately thirty percentage, seventeen percentage female respondent were farmers and six percentage pursue business as their occupation.

Table 1. KMO and Bartlett's Test for suitability of the data

| | | |
|--|------|----------|
| Kaiser-Meyer-Olkin Measure of Sampling Adequacy. | | .896 |
| Approx. Chi-Square | | 3334.793 |
| Bartlett's Test of Sphericity | Df | 528 |
| | Sig. | .000 |

Table1 shows the suitability of the data, as the value of Kaiser-Meyer-Olkin Measure of sample adequacy is 0.896 which is greater than 0.5 and close to 1.0, and significance level .000, it shows the compatibility of the variable for the factor analysis conducted.

Extraction Method: Principal Component Analysis.

The table 2 above shows that the factor analysis has reduces the thirty three variables into seven sub dimension, which belongs to the three important components that is, Perceived quality, Brand loyalty, Brand Image contributing to the Brand equity of the hospital.

Table 3. Represents commonalities or correlation of variables

| Particulars | Initial | Extraction |
|---|---------|------------|
| Prefer hospital for same treatment in future | 1.000 | .667 |
| Prefer hospital for different treatment | 1.000 | .615 |
| Hospital is my first choice | 1.000 | .730 |
| Recommend this hospital to other | 1.000 | .625 |
| Positive feeling towards hospital | 1.000 | .717 |
| If price variation occur switch to different hospital | 1.000 | .798 |
| Switch to another hospital in future | 1.000 | .794 |
| Complain others about the hospital | 1.000 | .743 |
| Trust the service | 1.000 | .723 |
| The hospital has clean environment | 1.000 | .442 |
| The hospital perform social activities | 1.000 | .705 |
| Better quality compared to other hospital | 1.000 | .713 |
| Good patient care | 1.000 | .718 |
| Treatment cost is reasonable | 1.000 | .581 |
| Staff member have effective communication with patient | 1.000 | .731 |
| Staff gives individual attention | 1.000 | .802 |
| Staff is caring | 1.000 | .793 |
| Staff is courteous | 1.000 | .825 |
| Staff member have efficient knowledge for the patient | 1.000 | .705 |
| Quick response from all the service | 1.000 | .702 |
| Housekeeping personnel is gentle | 1.000 | .634 |
| Staff is neat and tidy | 1.000 | .613 |
| Hospital keeps record up-to-date and accurate | 1.000 | .700 |
| The hospital has adequate stock of medicine | 1.000 | .627 |
| The hospital has modern equipments | 1.000 | .626 |
| Lighting and ventilation is good | 1.000 | .725 |
| Electricity facility are good | 1.000 | .706 |
| Drinking water facility is good | 1.000 | .650 |
| Sewerage facilities are satisfactory | 1.000 | .636 |
| Transportation facilities are satisfactory | 1.000 | .668 |
| The hospital's physical facilities are visually appealing | 1.000 | .706 |
| Security facility is sufficient and effective | 1.000 | .732 |
| The hospital provides good parking area | 1.000 | .422 |

Table 6. Variables contributing more and less to the perceived quality and enhancing Brand equity

| SNO. | VARIABLES CONTRIBUTING MORE TO PERCEIVED QUALITY COMPONENT | SCORE |
|------|--|---------------------------------|
| 1. | Staff is courteous | 0.825 |
| 2. | Staff gives individual attention | 0.802 |
| 3. | Staff is caring | 0.793 |
| 4. | Security facility is sufficient and effective | 0.732 |
| 5. | Staff member have effective communication with patient | 0.731 |
| 6. | Lighting and ventilation is good | 0.725 |
| 7. | Electricity facility are good | 0.706 |
| 8. | The hospital's physical facilities are visually appealing | 0.706 |
| 9. | Staff member have efficient knowledge for the patient | 0.705 |
| 10. | Quick response from all the services | 0.702 |
| | | |
| SNO. | VARIABLES CONTRIBUTING LESS TO PERCEIVED QUALITY COMPONENT | (Score above 0.6 and up to 0.7) |
| 1. | Hospital keeps record up-to-date and accurate | 0.70 |
| 2. | Transportation facilities are satisfactory | 0.668 |
| 3. | Drinking water facility is good | 0.650 |
| 4. | Sewerage facilities are satisfactory | 0.636 |
| 5. | Housekeeping personnel is gentle | 0.634 |
| 6. | Hospital has adequate stock of medicine | 0.627 |
| 7. | The hospital has modern equipments | 0.626 |

Table 6 shows variables contributing and enhancing the Brand Equity of the hospital, all these variables are part of perceived quality.

Table 7. Variables contributing more or less to Brand loyalty of the hospital

| SNO | VARIABLES CONTRIBUTING MORE TO BRAND LOYALTY | SCORE(0.7 AND ABOVE) |
|-----|--|-----------------------|
| 1. | Not switching to other hospital in future | 0.794 |
| 2. | Not complain about the hospital, if any | 0.743 |
| 3. | Trust the service of the hospital | 0.723 |
| 4. | Have positive feeling about the hospital | 0.717 |
| SNO | VARIABLES CONTRIBUTING LESS TO BRAND LOYALTY | SCORE |
| 1. | Recommend this hospital to others | 0.625 |

Table 7 shows the variable contributing to Brand equity and enhances Brand loyalty of the hospital. The first four variables with higher scores have more contribution towards brand equity.

Table 8. Variables contributing more, less and adversely to Brand image of the hospital

| SNO | VARIABLES CONTRIBUTING MORE TO BRAND IMAGE | SCORE |
|--|--|-------|
| 1. | The hospital is my first choice | 0.730 |
| 2. | Good patient care | 0.718 |
| 3. | Better quality compared to other hospital | 0.713 |
| VARIABLES CONTRIBUTING LESSTO BRAND IMAGE | | SCORE |
| 1. | Prefer this hospital for different treatment | 0.66 |
| 2. | Prefer hospital for same treatment | 0.615 |
| VARIABLES CONTRIBUTING ADVERSLY TO BRAND IMAGE | | SCORE |
| 1. | Parking area facility | 0.422 |

Table 8 represents variable contributing more and less to brand image and hence affecting Brand equity respectively. The table also shows that the variable parking area facility has low score and hence it adversely affects the Brand equity.

V. Conclusion

After factor analysis of 33 variables six sub dimensions were found that contribute to three major component of brand equity, out of which perceived quality contribute the highly to brand equity with maximum number of factor loading.

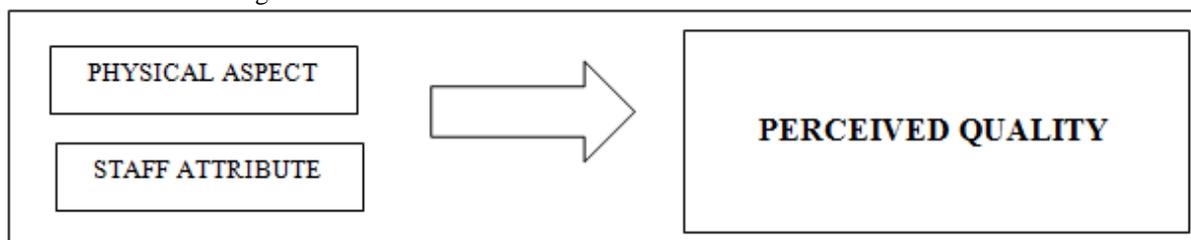

Figure 3: Sub dimensions that belongs to component Perceived Quality

Fig 3 shows that the sub dimensions physical aspect, which includes lighting, drinking, transportation, physical, security, sewerage, medical record, medicine facility and staff attribute belongs to the perceived quality component of the Brand Equity of the hospital.

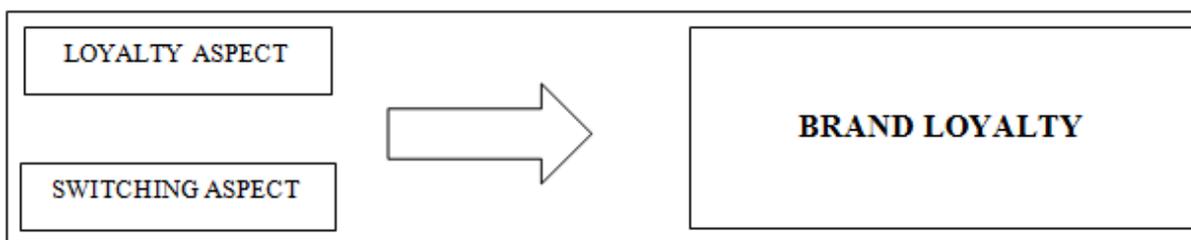

Figure4: Sub dimensions that belongs to component Brand Loyalty

Fig 4 shows that the sub dimension Loyalty aspect, which includes trust about the service, positive and clean environment, and switching aspect, belongs to the Brand loyalty component of the Brand Equity of the hospital.

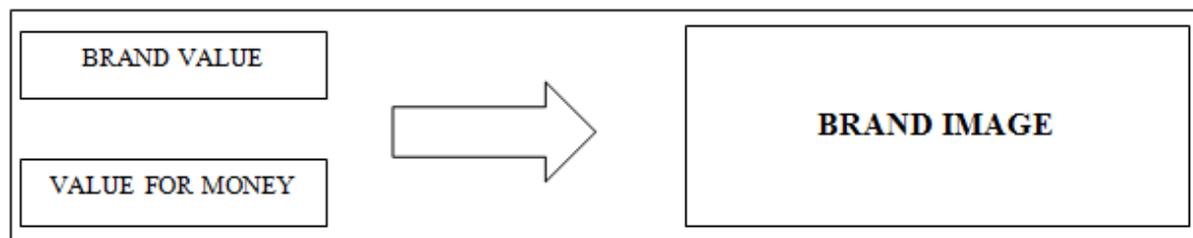

Figure5: Sub dimensions that belongs to component Brand Image

Perceived quality enhances the Brand equity of the hospital with scores of all the variables above 0.70. Variables being lighting, electricity, sewerage security facility, medicine stock availability, various staff attribute such as being caring, courteous, having sufficient knowledge, giving quick response ,giving individual attention to the staff member. Variable such as “Trust the service of the hospital” with score of 0.723, “positive feeling about the hospital” with 0.717, “better quality compared to other hospital” with 0.713 and “not switching to other hospital if there is variation in the price” with 0.794 scores ,indicates high levels of brand loyalty thus contributing to Brand equity of hospital. “Preference of hospital for same and different treatment”, “performance of social activity by the hospital”, “good patient care” were variables with sufficient score of 0.667, 0.615, 0.705 supporting Brand image thereby enhancing Brand equity. After the analysis it was found that two variables which are parking facility and treatment cost, affected the Brand image adversely, with score of 0.581 and 0.422. So the parking area facility can be improved using pricing mechanism, outsourcing the parking facility, providing the main parking area on operating lease.

Acknowledgements

We acknowledge with a grateful heart the contribution of all those who have in one way or other have helped us to complete this project. We also thank Mr. Suhan Mendon for helping us gain an opportunity to do this research. We extend our heartfelt gratitude and sincere thanks to Dr. K. Pillai for his constant guidance and suggestion in this study.
