Abstract:

AIM
To study the effect of low molecular weight heparin in the treatment of acute pancreatitis.

METHODOLOGY
Patients presenting to emergency room of Coimbatore medical college hospital with features of acute pancreatitis with duration of 72 hours or less.

RESULT
Total number of patients in the study was 100. Most common age group affected was 30-50 years of age. Out of 100; 86 were male patients and 14 were female patients. The low molecular weight heparin improves the microcirculations as a result of it relieves the abdominal pain, halt the progression of the disease, reduces the severity and complication, shortens the length of hospital stay and enhances the cure rate.

CONCLUSION
The low molecular weight heparin improves the microcirculations as a result of it relieves the abdominal pain, halt the progression of the disease, reduces the severity and complication, shortens the length of hospital stay and enhances the cure rate.

Keywords: Acute, pancreatitis, low molecular weight heparin.

I. Introduction

Acute pancreatitis is a disease which has many etiologies. Each etiology seems to affect the pancreatic acinar cell in some way that results in premature activation and retention of potent proteolytic enzymes.

In early stages of pancreatitis, macrophages, neutrophils, endothelial cells are activated. Preinflammatory cytokines are released and inflammation factors are elevated during acute pancreatitis and have been implicated in progression of pancreatitis associated microvascular disturbance and hemorrhagic necrosis. Ischemia, reperfusion injury and tiny thrombosis are closely associated with pancreatic microcirculation disturbance¹.

Severe acute pancreatitis [SAP] is severe and frequently a lethal disorder. Its mortality rate reaches upto 25 to 40%.² SAP is usually complicated with systemic inflammatory cascades and microcirculatory disturbances – related morbidity due to infected pre pancreatic necrosis.

Microcirculation disturbance is a trigger factor and plays an important role in the development of multi organ failure.³,⁴ Due to high mortality rate, search for newer modality of treatment is the hot point in the fields of pancreatic surgery.

Low molecular weight heparin (LMWH) is known to posses a special anti-thrombin activity which is stronger and safer than unfractionated heparin. LMWH can reduce the release of cytokines and inflammatory mediators, resulting in an improvement of the microcirculation of pancreas.

Our experimental study provides evidence that LMWH can block the initiation of an inflammatory storm, leading to improvement of microcirculation system; and has anti-thrombus effect to reduce the formation of microthrombosis in pancreas. These findings demonstrate the important therapeutic effect of LMWH in the treatment of acute pancreatitis.
Role of Low Molecular Weight Heparin In Treatment of Acute Pancreatitis In Cmch, Coimbatore.

II. Materials And Methods

- STUDY AREA: Coimbatore medical college hospital.
- STUDY POPULATION: Patients admitted in the emergency department of CMCH with a diagnosis of acute pancreatitis of duration of 72 hours or less.
- INCLUSION CRITERIA: Patients diagnosed with acute pancreatitis based on the following 2 criteria:
  1. Abdominal pain characteristic of acute pancreatitis (duration < 72 hrs).
  2. Serum amylase and/or lipase ≥ 3 times the upper limit of normal.
- STUDY PERIOD: December 2017 – September 2018
- SAMPLE SIZE: 100. All the patients eligible by inclusion criteria to be included in the study.
- STUDY DESIGN: An observational study to be conducted on patients admitted in CMCH for the above study. Informed consent will be taken from each.

IV. Conclusion

Findings From Our Study

Findings From Our Study Found that use of LMWH in treatment of Acute pancreatitis, which acts by improving microcirculation is an effective drug in the non-surgical treatment of acute pancreatitis. As per our study, the APACHE II Scores reduced considerably in the group treated with LMWH, suggesting that there was a considerable improvement in laboratory values, higher cure rate and lower complication. Such as Necrosis, Abscess, sepsis and Organ failure etc. Thus LMWH can effectively relieve acute pancreatitis related inflammation and reduce incidence of complications.

LMWH can rapidly relieve abdominal pain, halt the progression of diseases, reduce the severity and complication, shorten the length of hospital stay and enhance the cure rate.
