# The Co-action of Lie group on Hom Space 

Abid A. Al-Ta'ai ${ }^{1}$, Hoor M. Hussein ${ }^{2}$<br>${ }^{1}$ (Department of Mathematics, College of science, Al-Mustansiriya University, Iraq)<br>${ }^{2}$ (Department of Mathematics, College of Education, Al-Mustansiriya University, Iraq)

#### Abstract

G\) be a Lie group, and $\Pi^{*}$ is a dual representation of $G$, In this paper we will present and study the concepts of co-action of Lie group on Hom space, we recall the definition of tensor product of two representations of lie groups and construct the definition of co-action of Lie group, and also study the properties of this action. we use the co-action of Lie group on Hom space $\left(\operatorname{Hom}\left(W_{4}, W_{3}^{*}\right)\right)^{*}$ combining with another Hom space having the same structure with different vector space, $\left(\operatorname{Hom}\left(W_{2}, W_{1}^{*}\right)\right)^{*}$.so we have new co-action which called double co-action of Lie group G, denoted by Co-AAC_Lie group which acting on $\left(\operatorname{Hom}\left(\operatorname{Hom}\left(W_{4}, W_{3}^{*}\right), \operatorname{Hom}\left(W_{2}, W_{1}^{*}\right)\right)\right)^{*}$.

Keywords: Action Group, CO-AC-Lie group, CO-AAC-Lie group, Tensor space, Hom space.

## I. Introduction:

Throughout this paper, in 2004 Hall B. C. [1] wrote a book of Lie group for manifold theory and the relationship between Lie groups and Lie algebras. The reason of studying the representation is that a representation can be thought of as an action of group on some vector space. Such actions (representations) arise naturally in many branches of both mathematics and physics [2], [3], and it is important to understand them.
In [1], the Schur's lemma introduced the concept of action of Lie algebra on the space of linear maps from $\mathrm{W}_{2}$ into $W_{1}$, which denoted by $\operatorname{Hom}\left(W_{2}, W_{1}\right)$, also introduce the concept of action on tensor product of two representation of Lie algebra. Schur's lemma state: Suppose that $\pi_{1}$ and $\pi_{2}$ are representation of lie algebra acting on finite -dimensional space $W_{1}$ and $W_{2}$, respectively. Define an action of $g$ on Hom $\left(W_{2}, W_{1}\right)$, such that $\pi: \mathrm{g} \rightarrow \mathrm{gl}\left(\mathrm{Hom}\left(\mathrm{W}_{2}, \mathrm{~W}_{1}\right)\right)$,
$\pi(x)=\pi_{1} f-f \pi_{2}$, for all $x \in g$ and $f \in \operatorname{Hom}\left(W_{2}, W_{1}\right)$. and $\operatorname{Hom}\left(W_{2}, W_{1}\right) \cong W_{2}^{*} \otimes W_{1}$, as equivalence of representation.

In this paper we will present and study the concept of co-action on $\left(\operatorname{Hom}\left(\mathrm{W}_{2}, \mathrm{~W}_{1}^{*}\right)\right)$ *and the equivalent relation with the tensor product space. since $\operatorname{Hom}\left(W_{2}, W_{1}^{*}\right)$ is a vector space of all linear functional from $W_{2}$ into $W_{1}^{*}$, so $\left(\operatorname{Hom}\left(\operatorname{Hom}\left(W_{4}, W_{3}^{*}\right), \operatorname{Hom}\left(W_{2}, W_{1}^{*}\right)\right)\right)^{*}$ is dual vector space of all linear functional from ( $\left.\operatorname{Hom}\left(\mathrm{W}_{2}, \mathrm{~W}_{1}^{*}\right)\right)^{*}$ into $\left(\operatorname{Hom}\left(\mathrm{W}_{4}, \mathrm{~W}_{3}^{*}\right)\right)^{*}$, then the representation of G acting on this dual vector space is coaction of $G$ on this Hom space. Also we give an equivalent relation between CO-AC_Lie group and CO-AAC_Lie group on Hom and AC_Lie group with AAC_Lie group on Tensor products, and explain the actions structure by using diagram.

## II. Basic Concept:

In this section, we give the main definitions and some examples of group action, group representation, and tensor product, for more details, see $[9,10]$.

## (2.1) Definition, [8]:

Let $\mathbb{A}$ be a non empty set and let $G$ be a group with neutral element $\mathrm{e} \in \mathrm{G}$, a left action of G on $\mathbb{A}$ is a map $\varphi: \mathrm{G} \times \mathbb{A} \rightarrow \mathbb{A}$ such that satisfies the following $\varphi(\mathrm{e}, x)=x$ and $\varphi(g, \varphi(k, x))=\varphi(g k, x)$, for all $x \in \mathbb{A}$ and $g$, $k \in \mathrm{G}$. By definition of an action, for $g \in \mathrm{G}$ with inverse $g^{-1}$, we get:
$\varphi\left(g^{-1}, \varphi(g, x)\right)=\varphi(\mathrm{e}, x)=x$, for any $x \in \mathbb{A}$. Thus for any $g \in \mathrm{G}$ the map $x \mapsto \varphi(\mathrm{e}, x)$ is a bijection from $\mathbb{A} \rightarrow \mathbb{A}$, so we may also view $\varphi$ as a mapping of $G$ to the group of bijections of $\mathbb{A}$.

## (2.1) Definition, [4]:

A Lie group G is a finite dimensional smooth manifold G together with a group structure on G , such that the multiplication $\mathrm{G} \times \mathrm{G} \rightarrow \mathrm{G}$ and the attaching of an inverse $\mathrm{g} \rightarrow \mathrm{g}^{-1}: \mathrm{G} \rightarrow \mathrm{G}$ are smooth maps.

## (2.2) Definition, [7]:

A matrix Lie group is any subgroup $G$ of $G L(n, \mathbb{C})$ with the following property. If $A_{m}$ is any sequence of matrices in $G$ and $A_{m}$ converges to some matrix $A$ then $A \in G$, or $A$ is not invertible.
(2.3) Definition, [6]:

A finite-dimensional real (complex) representation of G is a Lie group homomorphism
$\Pi: G \longrightarrow G L(n, \mathbb{R}),(n \geq 1)$. Generally, a Lie group homomorphism $\Pi: G \longrightarrow G L(V)$, where $V$ is a finite dimensional real (complex) vector space with $\operatorname{dim} \mathrm{V} \geq 1$.

## (2.4) Definition, [6]:

Let $G$ and $H$ be two Lie groups. A map $f$ from $G$ to $H$ is called a Lie group homomorphism if $f$ is a group homomorphism and ${ }_{\mathrm{C}}^{\infty}$-map on H .

## (2.5) Definition, [1]:

If U and V are finite dimensional real or complex vector spaces, then a tensor product of U and V is a vector space W , together with a bilinear map $\phi: \mathrm{U} \times \mathrm{V} \longrightarrow \mathrm{W}(\mathrm{U} \otimes \mathrm{V})$ with the following property: If $\psi$ is any bilinear map of $\mathrm{U} \times \mathrm{V}$ into a vector space $\mathrm{W}_{1}$, then there exists a unique linear map $\bar{\psi}$ of W into $\mathrm{W}_{1}$, such that the following diagram commutes:

## (2.6) Definition, [1]:

Suppose $G$ is a Lie group and $\Pi$ is representation of $G$ acting on a finite dimensional vector space $V$. Then the dual representation $\Pi^{*}$ to $\Pi$ is the representation of G acting on $\mathrm{V}^{*}$ given by $\Pi^{*}(\mathrm{~g})=\left[\Pi\left(\mathrm{g}^{-1}\right)\right]^{\mathrm{tr}}$ The dual representation is also called contragredient representation.

## (2.7) Example:

Let $\Pi: S^{1} \longrightarrow \operatorname{Sl}(2, \mathbb{C})$, where $S^{1}=\{(\cos \theta, \sin \theta), 0 \leq \theta \leq 2 \pi\}, \stackrel{1}{S}=e^{i \theta}=\cos \theta+i \sin \theta$
$\mathrm{Sl}(2, \mathbb{C})=\left\{\left(\begin{array}{cc}\cos \theta & -\sin \theta \\ \sin \theta & \cos \theta\end{array}\right), 0 \leq \theta \leq 2 \pi\right\}$
Such that:

$$
\begin{aligned}
\Pi\left(\mathrm{e}^{\mathrm{i} \theta}\right) & =\left(\begin{array}{cc}
\cos \theta & -\sin \theta \\
\sin \theta & \cos \theta
\end{array}\right), 0 \leq \theta \leq 2 \pi \\
\Pi(\mathrm{~g})^{-1} & =\left(\begin{array}{cc}
\cos \theta & \sin \theta \\
-\sin \theta & \cos \theta
\end{array}\right) \\
{\left[\Pi(\mathrm{g})^{-1}\right]^{\mathrm{tr}} } & =\left(\begin{array}{cc}
\cos \theta & -\sin \theta \\
\sin \theta & \cos \theta
\end{array}\right)=\Pi^{*}(\mathrm{~g})
\end{aligned}
$$

## III. The Co-Action Of Lie Group On Hom And Tensor Product

In this section we study the co-action of G on the Hom space and on the tensor product.

## (3. 1) Proposition:

Let $\Pi_{\mathrm{i}}{ }^{*}: \mathrm{G} \rightarrow \mathrm{GL}\left(\mathrm{W}_{\mathrm{i}}{ }^{*}\right)$, for $\mathrm{i}=1,2$ be a dual representation of $\Pi_{\mathrm{i}}$, then the co-action of G on
(Hom $\left.\left(W_{2}, W_{1}{ }^{*}\right)\right)^{*}$ is given by a dual representation of $G$, such that: $\Pi^{*}(a)=\Pi_{2}^{*}(a)^{-1}{ }_{o} F^{*}{ }_{0} \Pi_{1}(a)$, for all $a \in G$.
Proof:
since $\Pi^{*}(a)=(\Pi(a))^{*}=\left(\Pi_{1}^{*}(a){ }_{0} \mathrm{~F}_{0} \Pi_{2}(\mathrm{a})^{-1}\right)^{*}$

$$
\begin{aligned}
& =\Pi_{2}{ }^{*}(\mathrm{a})^{-1}{ }_{\mathrm{o}} \mathrm{~F}^{*}{ }_{0} \Pi_{1}^{*}(\mathrm{a}) \\
& =\Pi_{2}{ }^{*}(\mathrm{a})^{-1}{ }_{0} \mathrm{~F}^{*}{ }_{\mathrm{o}} \Pi_{1}(\mathrm{a})
\end{aligned}
$$

Where $\mathrm{F}^{*}: \mathrm{W}_{1}{ }^{* *} \rightarrow \mathrm{~W}_{2}{ }^{*}$, and $\Pi^{*}(\mathrm{ab})=(\Pi(\mathrm{ab}))^{*}$

$$
\begin{aligned}
& =\left(\Pi(b)_{o} \Pi(a)\right)^{*} \\
& =\Pi^{*}(a)_{o} \Pi^{*}(b) .
\end{aligned}
$$

Thus, the co-action of G is a group homomorphism

## (3.2) Corollary:

Let $\Pi_{\mathrm{i}}: \mathrm{G} \rightarrow \mathrm{GL}(\mathrm{n}, \mathrm{k}) \cong \mathrm{GL}\left(\mathrm{W}_{\mathrm{i}}\right), \mathrm{i}=1,2$ be a matrix representation ,then the co-action of G on $\mathrm{GL}(\mathrm{n}, \mathrm{k})$ is a matrix representation defined by:
$\Pi(a)=\left(\Pi_{1}(a)^{-1}\right)^{t r}{ }_{0} F_{o} \Pi_{2}(a)^{-1}$, with duality $\Pi^{*}: \mathrm{G} \rightarrow \mathrm{GL}\left(\operatorname{Hom}\left(\mathrm{W}_{2}, \mathrm{~W}_{1}{ }^{*}\right)\right)^{*}$
, such that $\Pi^{*}(a)=\left(\Pi_{2}(a)\right)^{\operatorname{tr}}{ }_{o} F^{*}{ }_{0} \Pi_{1}(a)$, for all $a \in G$.
Proof:

$$
\begin{aligned}
\text { Since } \Pi^{*}(\mathrm{a})= & \left(\Pi(\mathrm{a})^{-1}\right)^{\operatorname{tr}} \\
& \left(\left(\Pi_{1}^{*}(\mathrm{a})_{o} \mathrm{~F}_{o} \Pi_{2}(\mathrm{a})^{-1}\right)^{-1}\right)^{\operatorname{tr}} \\
& =\left(\Pi_{2}(\mathrm{a})^{\operatorname{tr}}{ }_{o} \mathrm{~F}^{*}{ }_{o} \Pi_{1}(\mathrm{a})\right. \\
\text { And } \Pi^{*}(\mathrm{ab})= & \left((\Pi(\mathrm{ab}))^{-1}\right)^{\operatorname{tr}} \\
& =\left(\Pi(\mathrm{a})^{-1}{ }_{0} \Pi(\mathrm{~b})^{-1}\right)^{\operatorname{tr}} \\
& =\left(\Pi(\mathrm{a})^{-1}\right)^{\operatorname{tr}}{ }_{o}\left(\Pi(\mathrm{~b})^{-1}\right)^{\operatorname{tr}} \\
& =\Pi^{*}(\mathrm{a}){ }_{o} \Pi^{*}(\mathrm{~b}) \square
\end{aligned}
$$

## (3.4) proposition:

Let G be a lie group, $\mathrm{W}_{1}{ }^{*}$ and $\mathrm{W}_{2}$ are two finite vector spaces, the following assertion are equivalent:
(1) $\left(\operatorname{Hom}\left(W_{2}, W_{1}^{*}\right)\right)^{*}$
(2) $\operatorname{Hom}\left(\mathrm{W}_{1}^{* *}, \mathrm{~W}_{2}^{*}\right)$
(3) $\operatorname{Hom}\left(\mathrm{W}_{1}, \mathrm{~W}_{2}^{*}\right)$
(4) $\operatorname{Hom}\left(W_{1}, \operatorname{Hom}\left(W_{2}, k\right)\right)$
(5) $\operatorname{Hom}\left(\operatorname{Hom}\left(\operatorname{Hom}\left(W_{1}, k\right), \operatorname{Hom}\left(W_{2}, k\right)\right)\right.$
(6) $\left(\operatorname{Hom}\left(\mathrm{W}_{2}, \mathrm{~W}_{1}^{*}\right)\right)_{\substack{* * \ldots, ~ \\ \leftarrow \rightarrow}}=\left\{\operatorname{Hom}\left(\mathrm{W}_{1}, \mathrm{~W}_{2}^{*}\right) \quad\right.$ if n is odd Hom $\left(W_{2}, W_{1}{ }^{*}\right)$ if $n$ is even
Proof:
(1) To show $\left(\operatorname{Hom}\left(\mathrm{W}_{2}, \mathrm{~W}_{1}{ }^{*}\right)\right)^{*} \cong \operatorname{Hom}\left(\mathrm{~W}_{1}^{* *}, \mathrm{~W}_{2}^{*}\right)$, let $\mathrm{F} \in \operatorname{Hom}\left(\mathrm{W}_{2}, \mathrm{~W}_{1}{ }^{*}\right), \mathrm{F}: \mathrm{W}_{2} \rightarrow \mathrm{~W}_{1}{ }^{*}$, $\mathrm{F}^{*} \in\left(\operatorname{Hom}\left(\mathrm{~W}_{2}, \mathrm{~W}_{1}{ }^{*}\right)\right)^{*}$, thus
$\mathrm{F}^{*}: \mathrm{W}_{1}^{* *} \rightarrow \mathrm{~W}_{2}^{*}, \mathrm{~F}^{*} \in \operatorname{Hom}\left(\mathrm{~W}_{1}^{* *}, \mathrm{~W}_{2}^{*}\right)$, and there exist intertwining map
$\psi:\left(\operatorname{Hom}\left(\mathrm{W}_{2}, \mathrm{~W}_{1}{ }^{*}\right)\right)^{*} \rightarrow \operatorname{Hom}\left(\mathrm{~W}_{1}^{* *}, \mathrm{~W}_{2}^{*}\right),\left(\Pi^{*}(\mathrm{a})\right)(\mathrm{v})=\Pi^{*}(\mathrm{a}) \psi(\mathrm{v})$
For all $\mathrm{v} \in \mathrm{W}_{2}^{*}$ and $\psi$ is invertible map.
(2) To show $\left(\operatorname{Hom}\left(W_{2}, W_{1}{ }^{*}\right)\right)^{*} \cong \operatorname{Hom}\left(W_{1}, \operatorname{Hom}\left(W_{2}, k\right)\right)$

Since $W_{2}^{*}$ can be written as $\operatorname{Hom}\left(W_{2}, k\right)$, by proof of (1), thus:
$\operatorname{Hom}\left(W_{1}, W_{2}^{*}\right)=\operatorname{Hom}\left(W_{1}, \operatorname{Hom}\left(W_{2}, k\right)\right)$, by the same method we have the other parts

## (3.5) Example:

$$
\text { Let } \Pi_{1}: G \rightarrow S U(2) \text {, such that } \Pi_{1}(g)=\left(\begin{array}{cc}
\mathrm{e}^{\mathrm{i} \theta} & 0 \\
0 & \mathrm{e}^{-\mathrm{i} \theta}
\end{array}\right)
$$

And $\Pi_{2}: \mathbb{R} \rightarrow \mathrm{SO}(2)$, such that $\Pi_{2}(\theta)=\left(\begin{array}{cc}\cos \theta & -\sin \theta \\ \sin \theta & \cos \theta\end{array}\right)$ be matrix representation of $G$, then the co-action is given by : $\Pi^{*}(a)=\left(\Pi_{2}(a)\right)^{\operatorname{tr}}{ }_{0} F^{*}{ }_{0} \Pi_{1}(a)$

$$
\begin{aligned}
& =\left(\begin{array}{cc}
\cos \theta & \sin \theta \\
-\sin \theta & \cos \theta
\end{array}\right){ }_{o} \mathrm{~F}^{*}{ }_{\mathrm{o}}\left(\begin{array}{cc}
\mathrm{e}^{\mathrm{i} \theta} & 0 \\
0 & \mathrm{e}^{-\mathrm{i} \theta}
\end{array}\right) \\
& =\left(\begin{array}{cccc}
\mathrm{e}^{\mathrm{i} \theta} \cos \theta & \mathrm{e}^{\mathrm{i} \theta} \sin \theta & 0 & 0 \\
-\mathrm{e}^{\mathrm{i} \theta} \sin \theta & \mathrm{e}^{\mathrm{i} \theta} \cos \theta & 0 & 0 \\
0 & 0 & \mathrm{e}^{-\mathrm{i} \theta} \cos \theta & \mathrm{e}^{-\mathrm{i} \theta} \sin \theta \\
0 & 0 & -\mathrm{e}^{-\mathrm{i} \theta} \sin \theta & \mathrm{e}^{-\mathrm{i} \theta} \cos \theta
\end{array}\right) .
\end{aligned}
$$

## (3. 6) proposition:

If $\Pi$ is an action of $G$ on $\left(W_{2}^{*} \otimes W_{1}^{*}\right)$, such that: $(a)=\Pi_{2}^{*}(a)^{-1} \otimes \Pi_{1}^{*}(a)$,for all $a \in G$. then the co-action of $G$ on $\left(\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)^{*}$ is a dual representation of $\mathrm{G}, \Pi^{*}$, such that $\Pi^{*}: \mathrm{G} \rightarrow \mathrm{GL}\left(\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)^{*}$ defined by: $\Pi^{*}(a)=\Pi_{2}^{* *}(a)^{-1} \otimes \Pi_{1}^{* *}(a)$, for all $a \in G$.
Proof:
Since $(a)=\Pi_{2}^{*}(a)^{-1} \otimes \Pi_{1}^{*}(a)$, then $\Pi^{*}(a)=(\Pi(a))^{*}$

$$
\begin{aligned}
& =\left(\Pi_{2}^{*}(a)^{-1} \otimes \Pi_{1}^{*}(a)\right)^{*} \\
& =\Pi_{2}^{* *}(a)^{-1} \otimes \Pi_{1}^{* *}(a), \text { for all } a \in G .
\end{aligned}
$$

And $\Pi^{*}(\mathrm{ab})=\Pi_{2}^{* *}(\mathrm{ab})^{-1} \otimes \Pi_{1}^{* *}(\mathrm{ab})$

$$
=\Pi_{2}^{* *}(b)^{-1}\left(\Pi_{2}^{* *}(a)^{-1} \otimes \Pi_{1}^{* *}(a)\right) \Pi_{1}^{* *}(b) \ldots . .(1)
$$

$\Pi^{*}(\mathrm{a}) \Pi^{*}(\mathrm{~b})=\Pi^{*}(\mathrm{~b})_{o}\left(\Pi_{2}^{* *}(\mathrm{a})^{-1} \otimes \Pi_{1}^{* *}(\mathrm{a})\right)$

$$
=\Pi_{2}^{* *}(\mathrm{~b})^{-1}\left(\Pi_{2}^{* *}(\mathrm{a})^{-1} \otimes \Pi_{1}^{* *}(\mathrm{a})\right) \Pi_{1}^{* *}(\mathrm{~b}) \ldots \ldots .(2)
$$

Thus (1) \& (2) are equal then the co-action is a dual representation of G on $\left.\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)^{*}$

## (3.7)Corollary:

If the AC -lie group of G on $\mathrm{GL}(\mathrm{nm}, \mathrm{k}) \cong \mathrm{GL}\left(\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)$, is a matrix representation, then the AC -lie group of G on $\left(\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)^{*}$ is a matrix representation defined by:
$\Pi^{*}(a)=\Pi_{2}(a)^{-1} \otimes \Pi_{1}(a)$, for all $a \in G$.
Proof:

$$
\because \Pi_{1}^{* *}(\mathrm{a})=\Pi_{1}(\mathrm{a})
$$

Then $\Pi^{*}(a)=\Pi_{2}^{* *}(a)^{-1} \otimes \Pi_{1}^{* *}(a)$ $=\Pi_{2}(a)^{-1} \otimes \Pi_{1}(a)$, for all $a \in G$.
And $\Pi^{*}(\mathrm{ab})=\left((\Pi(\mathrm{ab}))^{-1}\right)^{\mathrm{tr}}$

$$
\begin{aligned}
& =\left(\Pi(\mathrm{b})^{-1} \Pi(\mathrm{a})^{-1}\right)^{\operatorname{tr}} \\
& =\left(\Pi(\mathrm{a})^{-1}{ }_{o} \Pi(\mathrm{~b})^{-1}\right)^{\operatorname{tr}} \\
& =\left(\Pi(\mathrm{a})^{-1}\right)^{\operatorname{tr}}\left(\Pi(\mathrm{b})^{-1}\right)^{\operatorname{tr}} \\
& =\Pi^{*}(\mathrm{a}){ }_{o} \Pi^{*}(\mathrm{~b})
\end{aligned}
$$

## (3.8) Proposition:

Let $\mathrm{W}_{1}$ and $\mathrm{W}_{2}$ are two finite vector spaces and $\mathrm{W}_{1}{ }^{*}, \mathrm{~W}_{1}{ }^{*}$ is the dual space of $\mathrm{W}_{\mathrm{i}}, \mathrm{i}-=1,2$ then the following assertions are equivalent:
(1) $\left(W_{2}^{*} \otimes W_{1}^{*}\right)^{*}$
(2) $\mathrm{W}_{2}^{* *} \otimes \mathrm{~W}_{1}^{* *}$
(3) $W_{2} \otimes W_{1}$
(4) $\left(\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)^{* * \ldots . .} \leftarrow \underset{\sim}{\mathrm{n}^{*}}=\left\{\begin{array}{l}\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}, \text { if } \mathrm{n} \text { is even integer number } \\ \mathrm{W}_{2}^{* *} \otimes \mathrm{~W}_{1}^{* *}, \text { if } \mathrm{n} \text { is odd integer number. }\end{array}\right.$

Proof:
(1) $\left(\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)^{*} \cong \mathrm{~W}_{2}^{* *} \otimes \mathrm{~W}_{1}^{* *}$, we must show that
$\psi: \mathrm{W}_{2}^{* *} \times \mathrm{W}_{1}^{* *} \rightarrow \mathrm{~W}_{2}^{* *} \otimes \mathrm{~W}_{1}^{* *}$ is a bilinear map, by:
$\left(\mathrm{w}_{2}^{* *}, \mathrm{w}_{1}^{* *}\right)=\mathrm{w}_{2}^{* *}(\mathrm{v}) \mathrm{w}_{1}^{* *}$, for all $\mathrm{v} \in \mathrm{W}_{2}, \mathrm{w}_{2}^{* *} \in \mathrm{~W}_{2}^{* *}, \mathrm{w}_{1}^{* *} \in \mathrm{~W}_{1}^{* *}$.
$\left(\alpha \mathrm{w}_{2}^{* *}+\beta \mathrm{w}_{2}^{* * \prime}, \mathrm{w}_{1}^{* *}\right)=\left(\alpha \mathrm{w}_{2}^{* *}+\beta \mathrm{w}_{2}^{* * \prime}\right)(\mathrm{v}) \mathrm{w}_{1}^{* *}=\left(\alpha \mathrm{w}_{2}^{* *}(\mathrm{v}) \mathrm{w}_{1}^{* *}+\beta \mathrm{w}_{2}^{* * \prime}(\mathrm{v}) \mathrm{w}_{1}^{* *}\right)=\alpha \psi\left(\mathrm{w}_{2}^{* *}, \mathrm{w}_{1}^{* *}\right)+\beta \psi\left(\mathrm{w}_{2}^{* * \prime}, \mathrm{w}_{1}^{* *}\right)$.
Other for all $\mathrm{w}_{1}^{* *}, \mathrm{w}_{1}^{* *} \in \mathrm{~W}_{1}^{* *}, \mathrm{w}_{2}^{* *} \in \mathrm{~W}_{2}^{* *}$.
$\psi\left(\mathrm{w}_{2}^{* *}, \alpha \mathrm{w}_{1}^{* *}+\beta \mathrm{w}_{1}^{* * \prime}\right)=\mathrm{w}_{2}^{*}(\mathrm{v})\left(\alpha \mathrm{w}_{1}^{* *}+\beta \mathrm{w}_{1}^{* * \prime}\right)$
$=\mathrm{w}_{2}^{* *}(\mathrm{v})\left(\alpha \mathrm{w}_{1}^{* *}\right)+\mathrm{w}_{2}^{* *}(\mathrm{v})\left(\beta \mathrm{w}_{1}^{* *}\right)$
$=\left(\mathrm{w}_{2}^{* *}(\mathrm{v}) \mathrm{w}_{1}^{* *}\right)+\beta\left(\mathrm{w}_{2}^{* *}(\mathrm{v}) \mathrm{w}_{1}^{* *^{\prime}}\right)$
$=\alpha\left(\mathrm{w}_{2}^{* *}, \mathrm{w}_{1}^{* *}\right)+\beta \psi\left(\mathrm{w}_{2}^{* *}, \mathrm{w}_{1}^{* * \prime}\right)$, for all $\alpha, \beta \in \mathrm{k}$.

So $\psi: \mathrm{W}_{2}^{* *} \times \mathrm{W}_{1}^{* *} \rightarrow\left(\mathrm{~W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)^{*}$ is a bilinear map, thus we use the tensor product and universal property of this tensor product, we get a unique linear map $\Omega$. So by universal property of tensor product there exist a unique linear map $\Omega$ : $\left(\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)^{*} \rightarrow \mathrm{~W}_{2}^{* *} \times \mathrm{W}_{1}^{* *}$, defined by:
$\Omega\left(\mathrm{w}_{2}^{*} \otimes \mathrm{w}_{1}^{*}\right)=\mathrm{w}_{2}^{* *}(\mathrm{v}) \mathrm{w}_{1}^{* *}$, and this make the above diagram commutative.
Define $\xi: \mathrm{W}_{2}^{* *} \otimes \mathrm{~W}_{1}^{* *} \rightarrow\left(\mathrm{~W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)^{*}$, defined by:
$\xi\left(w_{2}^{* *}(v) w_{1}^{* *}\right)=\left(w_{2}^{*} \otimes w_{1}^{*}\right)^{*}$, for all $v \in W_{2}, w_{2}^{* *} \in W_{2}^{* *}, w_{1}^{* *} \in W_{1}^{* *}$.
Since $\xi^{-1}=\Omega$ is a linear map and $\Omega$ is an intertwining map and invertible,
where: $\xi\left(\mathrm{w}_{2}^{*} \otimes \mathrm{w}_{1}^{*}\right)=\mathrm{w}_{2}^{* *}(\mathrm{v}) \mathrm{w}_{1}^{* *}$
The representation of $\left(\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)^{*}$ is:
$\Pi^{*}(a)=\left(\Pi_{2}^{*}(a)^{-1} \otimes \Pi_{1}^{*}(a)\right)^{*}$

$$
=\Pi_{2}^{* *}(\mathrm{a})^{-1} \otimes \Pi_{1}^{* *}(\mathrm{a}),
$$

$\left(\Pi^{*}(a)\right)(v)=\Pi^{*}(a) \Omega(v)$, for all $v \in W_{2}$.

(4)If $n=2$

$$
\begin{aligned}
\left(\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)^{* *} & =\left(\mathrm{W}_{2}^{* *} \otimes \mathrm{~W}_{1}^{* *}\right)^{*} \\
& =\mathrm{W}_{2}^{* * *} \otimes \mathrm{~W}_{1}^{* * *}=\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*},\left(\mathrm{~W}_{2}^{* * *} \cong \mathrm{~W}_{2}^{*}, \mathrm{~W}_{1}^{* * *} \cong \mathrm{~W}_{1}^{*}\right) .
\end{aligned}
$$

In general, if n is odd $\left(\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right) \leftarrow \mathrm{n} \rightarrow=\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}$.
All parts are equivalence representation in the same way of (1)

## (3.9)Example:

$$
\text { let } \Pi_{1}: \mathrm{G} \rightarrow \mathrm{SO}(3), \Pi_{1}(\mathrm{~g})=\left(\begin{array}{ccc}
\cos 2 \theta & -\sin 2 \theta & 0 \\
\sin 2 \theta & \cos 2 \theta & 0 \\
0 & 0 & 1
\end{array}\right) \text {, and } \Pi_{2}: G \rightarrow \mathrm{SUT}_{1}(\mathbb{R}) \text {, }
$$

$\Pi_{2}(g)=\left(\begin{array}{ll}1 & \mathrm{n} \\ 0 & 1\end{array}\right)$, $\mathrm{n} \in$ z.be matrix representation of lie group G then the co-action is given by:
$\Pi^{*}(\mathrm{~g})=\Pi_{2}(\mathrm{~g})^{-1} \otimes \Pi_{1}(\mathrm{~g})$,

$$
\begin{aligned}
& =\left(\begin{array}{ll}
1 & \mathrm{n} \\
0 & 1
\end{array}\right)^{-1} \otimes\left(\begin{array}{cccc}
\cos 2 \theta & -\sin 2 \theta & 0 \\
\sin 2 \theta & \cos 2 \theta & 0 \\
0 & 0 & 1
\end{array}\right)=\left(\begin{array}{cc}
1 & -\mathrm{n} \\
0 & 1
\end{array}\right) \otimes\left(\begin{array}{ccc}
\cos 2 \theta & -\sin 2 \theta & 0 \\
\sin 2 \theta & \cos 2 \theta & 0 \\
0 & 0 & 1
\end{array}\right) \\
& =\left(\begin{array}{cccccc}
\cos 2 \theta & -\sin 2 \theta & 0 & -\mathrm{ncos} 2 \theta & \mathrm{n} \sin 2 \theta & 0 \\
\sin 2 \theta & \cos 2 \theta & 0 & -\mathrm{n} \sin 2 \theta & -\mathrm{n} \cos 2 \theta & 0 \\
0 & 0 & 1 & 0 & 0 & -\mathrm{n} \\
0 & 0 & 0 & \cos 2 \theta & -\sin 2 \theta & 0 \\
0 & 0 & 0 & \sin 2 \theta & \cos 2 \theta & 0 \\
0 & 0 & 0 & 0 & 0 & 1
\end{array}\right) .
\end{aligned}
$$

## IV. The Co-Action Of Lie Group On Hom Space And Tensor Product:

## (4.1) Proposition:

Let $\Pi_{i}, i=1,2,3,4$, be a matrix representation of $W_{i}, i=1,2,3,4$ and the AAC_Lie group of commutative $G$ on $\operatorname{Hom}\left(\operatorname{Hom}\left(W_{4}, W_{3}^{*}\right), \operatorname{Hom}\left(W_{2}, W_{1}^{*}\right)\right)$, given by: $\Pi(a)=\left(\left(\left(\Pi_{4}(a)^{-1} F_{3} \Pi_{3}^{*}(a)\right) F_{2} \Pi_{2}(a)^{-1}\right) F_{1} \Pi_{1}^{*}(a)\right)$, for all $\mathrm{a} \in \mathrm{G}$. Then the co-action of AAC_Lie group is a dual representation $\Pi^{*}(\mathrm{a})$, given by: $\Pi^{*}(\mathrm{a})=\left(\left(\Pi_{1}(\mathrm{a}) \mathrm{F}_{1}{ }^{*} \Pi_{2}^{*}(\mathrm{a})^{-1}\right) \mathrm{F}_{2}{ }^{*} \Pi_{3}(\mathrm{a})\right) \mathrm{F}_{3}{ }^{*} \Pi_{4}{ }^{*}(\mathrm{a})^{-1}$, for all $\mathrm{a} \in \mathrm{G}$.
Proof:
Let $\Pi^{*}(\mathrm{a}): \mathrm{G} \longrightarrow \mathrm{GL}\left(\operatorname{Hom}\left(\operatorname{Hom}\left(\mathrm{W}_{4}, \mathrm{~W}_{3}^{*}\right) \text {, } \operatorname{Hom}\left(\mathrm{W}_{2}, \mathrm{~W}_{1}^{*}\right)\right)\right)^{*}$, thus:

$$
\begin{aligned}
\Pi^{*}(\mathrm{a}) & =\left(\left(\left(\Pi_{4}(\mathrm{a})^{-1} \mathrm{~F}_{3} \Pi_{3}^{*}(\mathrm{a})\right) \mathrm{F}_{2} \Pi_{2}(\mathrm{a})^{-1}\right) \mathrm{F}_{1} \Pi_{1}^{*}(\mathrm{a})\right)^{*} \\
& =\left(\left(\Pi_{1}^{* *}(\mathrm{a}) \mathrm{F}_{1}{ }^{*} \Pi_{2}^{*}(\mathrm{a})^{-1}\right) \mathrm{F}_{2}{ }^{*} \Pi_{3}^{* *}(\mathrm{a})\right) \mathrm{F}_{3}{ }^{*} \Pi_{4}{ }^{*}(\mathrm{a})^{-1} \\
& =\left(\left(\Pi_{1}(\mathrm{a}) \mathrm{F}_{1}{ }^{*} \Pi_{2}^{*}(\mathrm{a})^{-1}\right) \mathrm{F}_{2}{ }^{*} \Pi_{3}(\mathrm{a})\right) \mathrm{F}_{3}{ }^{*} \Pi_{4}{ }^{*}(\mathrm{a})^{-1},
\end{aligned}
$$

Where
$\mathrm{F}_{1}{ }^{*}: \mathrm{W}_{2}{ }^{*} \rightarrow \mathrm{~W}_{1}, \mathrm{~F}_{2}^{*}: \mathrm{W}_{3} \rightarrow \mathrm{~W}_{2}^{*}, \mathrm{~F}_{3}^{*}: \mathrm{W}_{4}^{*} \rightarrow \mathrm{~W}_{3}$,
To show that co_action is homo. Of Lie group:
$\Pi^{*}(\mathrm{ab})=(\Pi(\mathrm{ab}))^{*}$

$$
\begin{aligned}
& =(\Pi(a) \Pi(b))^{*} \text {, since } \Pi \text { is a representation of G } \\
& =\Pi^{*}(a) \Pi^{*}(b) \text {, since } G \text { is commutative Lie gp. }
\end{aligned}
$$

Hence the co-action is a dual representation of G.

## (4.2) Proposition:

Let $\mathrm{W}_{\mathrm{i}}, \mathrm{i}=1,2,3,4$ be a finite dimensional vector space having duality $\mathrm{W}_{\mathrm{i}}^{*}, \mathrm{i}=1,2,3,4$ then we have the following assertions are equivalent :

1) $\left(\operatorname{Hom}\left(\operatorname{Hom}\left(W_{4}, W_{3}^{*}\right), \operatorname{Hom}\left(W_{2}, W_{1}^{*}\right)\right)\right)^{*}$
2) $\operatorname{Hom}\left(\operatorname{Hom}\left(W_{2}, W_{1}^{*}\right)^{*}, \operatorname{Hom}\left(W_{4}, W_{3}^{*}\right)^{*}\right)$
3) $\operatorname{Hom}\left(\operatorname{Hom}\left(W_{1}{ }^{* *}, W_{2}^{*}\right), \operatorname{Hom}\left(W_{3}{ }^{* *}, W_{4}^{*}\right)\right)$
4) $\operatorname{Hom}\left(\operatorname{Hom}\left(W_{1}, W_{2}^{*}\right), \operatorname{Hom}\left(W_{3}, W_{4}^{*}\right)\right)$
5) $\operatorname{Hom}\left(\operatorname{Hom}\left(W_{1}, \operatorname{Hom}\left(W_{2}, k\right)\right), \operatorname{Hom}\left(W_{3}, \operatorname{Hom}\left(W_{4}, k\right)\right)\right)$
6) $\operatorname{Hom}\left(\operatorname{Hom}\left(W_{1}, W_{2}^{*}\right), \operatorname{Hom}\left(W_{3}, \operatorname{Hom}\left(W_{4}, k\right)\right)\right)$
7) $\left(\operatorname{Hom}\left(\operatorname{Hom}\left(\mathrm{W}_{4}, \mathrm{~W}_{3}^{*}\right) \operatorname{Hom}\left(\mathrm{W}_{2}, \mathrm{~W}_{1}^{*}\right)\right) \stackrel{\substack{* * \cdots *}}{\leftarrow \mathrm{n} \rightarrow}=\right.$

$$
\left\{\begin{array}{l}
\operatorname{Hom}\left(\operatorname{Hom}\left(W_{4}, W_{3}^{*}\right), \operatorname{Hom}\left(W_{2}, W_{1}^{*}\right)\right) \text { if } n \text { even } \\
\operatorname{Hom}\left(\operatorname{Hom}\left(W_{1}, W_{2}^{*}\right), \operatorname{Hom}\left(W_{3}, W_{4}^{*}\right)\right) \text { if } n \text { odd } .
\end{array}\right.
$$

Proof:

1) To prove (1) $\cong(2)$, let

$$
\Psi:\left(\operatorname{Hom}\left(\operatorname{Hom}\left(\mathrm{W}_{4}, \mathrm{~W}_{3}^{*}\right), \operatorname{Hom}\left(\mathrm{W}_{2}, \mathrm{~W}_{1}^{*}\right)\right)\right)^{*} \rightarrow \operatorname{Hom}\left(\operatorname{Hom}\left(\mathrm{~W}_{2}, \mathrm{~W}_{1}^{*}\right)^{*}, \operatorname{Hom}\left(\mathrm{~W}_{4}, \mathrm{~W}_{3}^{*}\right)^{*}\right)
$$

$\Psi\left(\Pi^{*}(\mathrm{a})\right)(\mathrm{v})=\Pi^{*}(\mathrm{a}) \Psi(\mathrm{v})$, for all $\mathrm{v} \in \operatorname{Hom}\left(\operatorname{Hom}\left(\mathrm{W}_{2}, \mathrm{~W}_{1}^{*}\right)^{*}, \operatorname{Hom}\left(\mathrm{~W}_{4}, \mathrm{~W}_{3}^{*}\right)^{*}\right)$
$\Psi$ is an isomorphism map.
2) To prove (4) $\cong(5)$

Since $W_{2}^{*} \cong \operatorname{Hom}\left(W_{2}, k\right)$ and $W_{4}^{*} \cong \operatorname{Hom}\left(W_{4}, k\right)$, hence $\operatorname{Hom}\left(W_{1}, W_{2}^{*}\right) \cong \operatorname{Hom}\left(W_{1}, \operatorname{Hom}\left(W_{2}, k\right)\right)$
And $\operatorname{Hom}\left(W_{3}, W_{4}^{*}\right) \cong \operatorname{Hom}\left(W_{3}, \operatorname{Hom}\left(W_{4}, k\right)\right)$ $\qquad$
Then from (1) \& (2)
$\operatorname{Hom}\left(\operatorname{Hom}\left(W_{1}, W_{2}^{*}\right), \operatorname{Hom}\left(W_{3}, W_{4}^{*}\right)\right) \cong \operatorname{Hom}\left(\operatorname{Hom}\left(W_{1}, \operatorname{Hom}\left(W_{2}, k\right)\right), \operatorname{Hom}\left(W_{3}, \operatorname{Hom}\left(W_{4}, k\right)\right)\right)$.
** The other parts proving by the same method.

## (4.3) Proposition:

Let $\Pi: \mathrm{G} \rightarrow \mathrm{GL}\left(\left(\mathrm{W}_{4} \otimes \mathrm{~W}_{3}\right) \otimes\left(\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)\right)$ be a representation of comm. G acting on $\left(\left(\mathrm{W}_{4} \otimes \mathrm{~W}_{3}\right) \otimes\right.$ $\left.\left(\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)\right)$, then the co-action is a dual representation of G , acting on $\left(\left(\mathrm{W}_{4}{ }^{*} \otimes \mathrm{~W}_{3}{ }^{*}\right) \otimes\left(\mathrm{W}_{2} \otimes \mathrm{~W}_{1}\right)\right)$, such that : $\Pi^{*}(a)=\left(\left(\left(\Pi_{4}{ }^{*}(a)^{-1} \otimes \Pi_{3}{ }^{*}(a)\right) \otimes \Pi_{2}(a)^{-1}\right) \otimes \Pi_{1}(a)\right), a \in G$.
Proof:
Since $(a)=\left(\left(\left(\Pi_{4}(a)^{-1} \otimes \Pi_{3}(a)\right) \otimes \Pi_{2}^{*}(a)^{-1}\right) \otimes \Pi_{1}^{*}(a)\right)$,
Then $\Pi^{*}(\mathrm{a})=\left(\left(\left(\Pi_{4}(\mathrm{a})^{-1} \otimes \Pi_{3}(\mathrm{a})\right) \otimes \Pi_{2}^{*}(\mathrm{a})^{-1}\right) \otimes \Pi_{1}^{*}(\mathrm{a})\right)^{*}$

$$
\begin{aligned}
& =\left(\left(\left(\Pi_{4}{ }^{*}(a)^{-1} \otimes \Pi_{3}{ }^{*}(a)\right) \otimes \Pi_{2}^{* *}(a)^{-1}\right) \otimes \Pi_{1}^{* *}(a)\right) \\
& =\left(\left(\left(\Pi_{4}^{*}(a)^{-1} \otimes \Pi_{3}^{*}(a)\right) \otimes \Pi_{2}(a)^{-1}\right) \otimes \Pi_{1}(a)\right), \text { for all } a \in G .
\end{aligned}
$$

Which is a representation of G acting on $\left(\left(\mathrm{W}_{4}{ }^{*} \otimes \mathrm{~W}_{3}{ }^{*}\right) \otimes\left(\mathrm{W}_{2} \otimes \mathrm{~W}_{1}\right)\right)$.

$$
\left(k \times W_{4}\right) \times\left(k \times W_{3}\right) \times\left(W_{2} \times W_{1}\right)
$$

$\operatorname{Dim}\left(\left(\mathrm{W}_{4} \otimes \mathrm{~W}_{3}\right) \otimes\left(\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)\right)=\mathrm{n}_{1} \cdot \mathrm{n}_{2} \cdot \mathrm{n}_{3} \cdot \mathrm{n}_{4}$

$$
=\operatorname{dim}\left(\left(\mathrm{W}_{4}{ }^{*} \otimes \mathrm{~W}_{3}{ }^{*}\right) \otimes\left(\mathrm{W}_{2} \otimes \mathrm{~W}_{1}\right)\right) .
$$

Here $\operatorname{dim} W_{W}=n_{1}, \operatorname{dim} W_{3}=n_{2}, \operatorname{dim} W_{2}=n_{3}, \operatorname{dim} W_{1}=n_{4}$,
$\Pi^{*}(\mathrm{ab})=\left(\left(\left(\Pi_{4}^{*}(\mathrm{ab})^{-1} \otimes \Pi_{3}{ }^{*}(\mathrm{ab})\right) \otimes \Pi_{2}(\mathrm{ab})^{-1}\right) \otimes \Pi_{1}(\mathrm{ab})\right.$
$=\left(\Pi_{4}^{*}(\mathrm{~b})^{-1} \Pi_{4}{ }^{*}(\mathrm{a})^{-1}\right) \otimes\left(\Pi_{3}{ }^{*}(\mathrm{a}) \Pi_{3}{ }^{*}(\mathrm{~b})\right) \otimes\left(\Pi_{2}(\mathrm{~b})^{-1} \Pi_{2}(\mathrm{a})^{-1}\right) \otimes\left(\Pi_{1}(\mathrm{a}) \Pi_{1}(\mathrm{~b})\right)$
$=\left(\left(\left(\Pi_{4}{ }^{*}(\mathrm{~b})^{-1} \otimes \Pi_{3}{ }^{*}(\mathrm{~b})\right) \otimes \Pi_{2}(\mathrm{~b})^{-1}\right) \otimes \Pi_{1}(\mathrm{~b})\right)\left(\left(\left(\left(\Pi_{4}{ }^{*}(\mathrm{a})^{-1} \otimes \Pi_{3}{ }^{*}(\mathrm{a})\right) \otimes \Pi_{2}(\mathrm{a})^{-1}\right) \otimes \Pi_{1}(\mathrm{a})\right)\right.$, since $G$ is commutative lie group, for all $\mathrm{a}, \mathrm{b} \in \mathrm{G}$.

## (4.4) Corollary:

Let G be a matrix representation acting on $\mathrm{GL}\left(\left(\mathrm{W}_{4} \otimes \mathrm{~W}_{3}\right) \otimes\left(\mathrm{W}_{2}^{*} \otimes \mathrm{~W}_{1}^{*}\right)\right)$, then the co-AAC_lie group of G on $\left(\left(\mathrm{W}_{4}{ }^{*} \otimes \mathrm{~W}_{3}{ }^{*}\right) \otimes\left(\mathrm{W}_{2} \otimes \mathrm{~W}_{1}\right)\right) \mathrm{is}:$
$\Pi^{*}(\mathrm{a})=\left(\left(\left(\Pi_{4}(\mathrm{a})\right)^{\mathrm{tr}} \otimes\left(\Pi_{3}(\mathrm{a})^{-1}\right)^{\mathrm{tr}} \otimes \Pi_{2}(\mathrm{a})^{-1}\right) \otimes \Pi_{1}(\mathrm{a})\right), \mathrm{a} \in \mathrm{G}$.

Proof:

```
\(\Pi^{*}(\mathrm{a})=\left(\Pi(\mathrm{a})^{-1}\right)^{\operatorname{tr}}\)
    \(=\left(\left(\left(\left(\Pi_{4}(a)^{-1} \otimes \Pi_{3}(a)\right) \otimes \Pi_{2}^{*}(a)^{-1}\right) \otimes \Pi_{1}^{*}(a)\right)^{-1}\right)^{\operatorname{tr}}\)
    \(\left.=\left(\left(\left(\Pi_{4}(\mathrm{a})\right)^{\operatorname{tr}} \otimes\left(\Pi_{3}(\mathrm{a})^{-1}\right)^{\operatorname{tr}}\right) \otimes \Pi_{2}(\mathrm{a})^{-1}\right) \otimes \Pi_{1}(\mathrm{a})\right)\), for all \(\mathrm{a} \in \mathrm{G}\).
And \(\Pi^{*}(\mathrm{ab})=\left(\Pi(\mathrm{ab})^{-1}\right)^{\operatorname{tr}}\)
    \(\begin{aligned} &=\left(\Pi(b)^{-1} \Pi(a)^{-1}\right)^{\operatorname{tr}} \\ &=\left(\Pi(a)^{-1}\right)^{\operatorname{tr}}\left(\Pi(b)^{-1}\right)^{\operatorname{tr}} \\ &=\Pi^{*}(a) \Pi^{*}(b)\end{aligned}\)
```

Hence the co-action is a matrix dual representation.

## V. Conclusion:

The main aim in this study is to look for an interesting action with new properties from a lemma of Schure, which states that the action of the tensor product of Lie algebras representations has interesting property.

Putting in mind that one of the two representations is usual and the other is dual to obtain results by relating the tensor product of dual representations with usual representations.
Our main work here is to study the concept of co-action on $\left(\operatorname{Hom}\left(W_{2}, W_{1}^{*}\right)\right)^{*}$ and the equivalent relation with the tensor product space combining these co-actions (dual representations) and to give a dual representation which acting on $\left(\operatorname{Hom}\left(\operatorname{Hom}\left(W_{4}, W_{3}^{*}\right), \operatorname{Hom}\left(W_{2}, W_{1}^{*}\right)\right)\right)^{*}$ and then generalize them.
