#### Abstract

A method of constructing a smallest congruence relation that is larger than a given equivalence relation on a lattice is explained. A method of constructing a congruence relation in which equivalence classes contain all least upper bounds and all greatest lower bounds for subsets of equivalence classes is explained; and this method constructs a smallest congruence relation with this property which is also larger than a given congruence relation in a lattice.

Keywords: Cardinal number, Transfinite induction principle, Congruence relation.

## I. Introduction

Let $(\mathrm{L}, \leq)$ or $(\mathrm{L}, \vee, \wedge)$ be a lattice. Let $\aleph$ be an infinite cardinal number. A subset A of L is $\aleph$-closed in L, if for any subset B of A for which $|B|<\aleph$, the least upper bound of B is in A, whenever it exists in $L$, and the greatest lower bound of B in A, whenever it exists in L. A subset A of L is said to be closed in L, if it אclosed in L , for every $\aleph$. An equivalence relation $\theta$ on L is said to be $\aleph$-closed, if every equivalence class induced by $\theta$ is $\aleph$-closed in $L$. The equivalence relation $\theta$ on L is said to be closed, if every equivalence class induced by $\theta$ is closed. To an equivalence relation on $L$, let us use an usual notation $x \equiv y(\bmod \theta)$, when $x$ and $y$ are related by $\theta$. Two equivalence relations $\theta$ and $\theta$ ' are ordered by the usual 'refinement' order relation: $\theta \leq \theta$ ' if $\mathrm{x} \equiv \mathrm{y}(\bmod \theta)$ implies $\mathrm{x} \equiv \mathrm{y}\left(\bmod \theta^{\prime}\right)$. An equivalence relation on L is said to be a congruence relation, if it has the following substitution properties: $\mathrm{x} \vee \mathrm{z} \equiv \mathrm{y} \vee \mathrm{z}(\bmod \theta)$ and $\mathrm{x} \wedge \mathrm{z} \equiv \mathrm{y} \wedge \mathrm{z}(\bmod \theta)$, whenever $\mathrm{x} \equiv \mathrm{y}(\bmod$ $\theta$ ) and $\mathrm{x}, \mathrm{y}, \mathrm{z} \in \mathrm{L}$.

If $\left(\theta_{\mathrm{i}}\right)_{\text {ieI }}$ is a collection of $\aleph$-closed (or, simply, closed) congruence relations on L , then the relation $\theta$ on $L$ defined by $x \equiv y(\bmod \theta)$ if and only if $x \equiv y\left(\bmod \theta_{\mathrm{i}}\right), \forall \mathrm{i} \in \mathrm{I}$, is also an $\aleph$-closed (or, simply, a closed) congruence relation on L . Thus $\theta=\wedge_{\mathrm{i} \in \mathrm{I}} \theta_{\mathrm{i}} \in \mathbb{\mathrm { C }}$ - ConL, the collection of all $\aleph$ - closed congruence relations on L , when $\theta_{\mathrm{i}} \in \mathbb{N} \mathrm{C}$ - ConL, $\forall \mathrm{i} \in \mathrm{I}$. Similarly $\mathrm{v}_{\mathrm{i} \in \mathrm{I}} \theta_{\mathrm{i}}$ is in $\mathbb{N} \mathrm{C}$-ConL, when $\mathrm{v}_{\mathrm{i} \in \mathrm{I}} \theta_{\mathrm{i}}$ is considered as $\wedge\{\phi$ $: \phi \in \mathrm{A}\}$, when $\mathrm{A}=\left\{\phi \in \mathbb{N} \mathrm{C}-\mathrm{Con} \mathrm{L}: \theta_{\mathrm{i}} \leq \phi, \forall \mathrm{i} \in \mathrm{I}\right\}$. If ConL denotes the collection of all congruence relations on L, it is known that ConL is a lattice, and an internal construction for least upper bound of a given sub collection is also known (see the proof of theorem 3.9 in [2]). So, an internal construction of $\mathrm{v}_{\mathrm{i} \in \mathrm{I}} \theta_{\mathrm{i}}$ in NC - ConL,when ( $\left.\theta_{\mathrm{i}}\right)_{\mathrm{i} \in \mathrm{I}} \subseteq \mathrm{N}^{\mathrm{C}} \mathrm{C}$-ConL, depends on construction of a smallest $\theta^{\prime \prime}$ in $\mathrm{N}^{\mathrm{C}}$-ConL such that $\theta^{\prime \prime} \geq \theta$, for given $\theta \in$ ConL. For this construction, another internal constructon of a smallest congruence relation $\theta$ on $L$ such that $\theta \geq \phi$ for a given equivalence relation $\phi$ on L is developed in this article. It is expected that all types of constructions may be helpful to understand congruence lattices(see: [3]).

## II. Construction of equivalence classes through transfinite induction

At every phase, an equivalence relation is to be found from a given equivalence relation, by means of a construction. A finite set of constructions have to be repeated to reach a desirable equivalence relation. So, a common construction procedure is to be defined in this section.

Let ( $\mathrm{L}, \mathrm{\vee}, \wedge$ ) be a given lattice. To each $\mathrm{i}=1,2, \ldots \mathrm{n}$, a fixed positive integer, let $\mathrm{P}_{\mathrm{i}}($ say $)$ denote a given common procedure which constructs an equivalence relation $\sim_{i}$ when it is applied on a given equivalence relation $\theta_{\mathrm{i}}$ with a result $\theta_{\mathrm{i}} \leq \sim_{\mathrm{i}}$. Let $\theta_{0}$ be a given equivalence relation on L . Let $\theta_{\mathrm{i}}$ be the equivalence relation that is obtained by following the procedure $P_{i}$ on $\theta_{i-1}$, for $i=1,2, \ldots n$. For $m n<m n+i \leq m n+n$, let $\theta_{m n+i}$ denote the equivalence relation that is obtained by the following the procedure $P_{i}$ on $\theta_{m n+i-1}$, for $m=1,2 \ldots .$. Now $\theta_{0} \leq \theta$ ${ }_{1} \leq \theta_{2} \leq \ldots$. Let $\theta_{\omega}$ be the supremum of the equivalence relations $\theta_{0}, \theta_{1}, \theta_{2}, \ldots$ in the lattice of all equivalence relations on $L$. Let us construct $\theta_{\omega+1} \theta_{\omega+2} \ldots$ one by one by following the procedures $P_{1} ; P_{2} ; \ldots P_{n} ; P_{1} ; P_{2} \ldots P_{n}, \ldots$ applied on $\theta_{\omega}, \theta_{\omega+1, \ldots}$ respectively. Now define $\theta_{\omega+\omega}$ as the supremum of the equivalence relations $\theta_{0}$, $\theta_{1}, \ldots, \theta_{\omega}, \theta_{\omega+1} \ldots$ in the lattice of equivalence relations on L . Thus, once a limiting ordinal $\alpha$ is reached, $\theta_{\alpha}$ is constructed as the supremum of $\theta_{i}, \mathrm{i}<\alpha$; and the procedures $\mathrm{P}_{1}, \mathrm{P}_{2}, \ldots \mathrm{P}_{\mathrm{n}}, \mathrm{P}_{1}, \mathrm{P}_{2}, \ldots \mathrm{P}_{\mathrm{n}} \ldots$ are applied on $\theta_{\alpha}, \theta_{\alpha+1}, \ldots$ to construct $\theta_{\alpha+1}, \theta_{\alpha+2} \ldots$ respectively and successively. This procedure leads to a 'stationary' equivalence relation in the sense that $\theta_{\beta}=\theta_{\beta+\alpha}$, for every ordinal $\alpha$. This happens because L is fixed and hence its cardinality
is fixed. Let us say that the equivalence relation $\theta_{\beta}$ is the stationary equivalence relation obtained by following the procedures $\mathrm{P}_{1}, \mathrm{P}_{2}, \ldots \mathrm{P}_{\mathrm{n}}$ on $\theta_{0}$.

## III. Equivalence relation to congruence relation

This section provides a construction to obtain a smallest congruence relation $\theta^{\prime}$ from a given equivalence relation $\theta$ such that $\theta \leq \theta^{\prime}$ on a lattice $L$. This construction is based on the following significant observation.
Lemma 3.1 Let $\theta$ be a given equivalence relation on a lattice ( $L, \vee, \wedge$ ). To each $x \in L$, let $[x]$ denote the equivalence class of $\theta$ containing $x$. Then $\theta$ is a congruence relation if and only if the following hold for every $x \in L$ : (i) $a \vee b \in[x]$ and $a \wedge b \in[x]$, whenever $a, b \in[x]$; (ii) ( $z \vee a) \wedge b \in[x]$ and ( $z \wedge a) \vee b \in[x]$, whenever $a, b \in[x]$, and $z \in L$; (iii) $a_{1} \vee b_{1} \in[x]$, whenever $a \vee b \in[x], a_{1} \in[a]$ and $b_{1} \in[b]$; (iv) $a_{1} \wedge b_{1} \in[x]$, whenever $a \wedge b \in[x], a_{1} \in[a]$ and $\mathrm{b}_{1} \in[\mathrm{~b}]$.
Proof: The proof follows from two facts:
(1) $\theta$ is a congruence relation if and only if $L / \theta$ is a lattice.
(2) A set with two binary operations is a lattice if and only if the binary operations satisfy idempotent law, commutativity law, associativity law, and absorption law (see: Theorem 1 in p. 18 in [1]).
Suppose (i),(ii),(iii) and (iv) are true. To each $\mathrm{a}, \mathrm{b} \in \mathrm{L}$, let us define $[\mathrm{a}] \vee[\mathrm{b}]=[\mathrm{a} \vee \mathrm{b}]$
and $[a] \wedge[b]=[a \wedge b]$. They are well defined in view of (iii) and (iv). The commutavity and associativity of these operations follow from the corresponding properties of $\vee$ and $\wedge$ in $L$. These operations satisfy idempotent law and absorption law, because of (i) and (ii). So L/ $\theta$ is a lattice so that $\theta$ is a congruence relation.

On the other hand, if $\theta$ is a congruence relation, then $L / \theta$ is a lattice so that (i), (ii),(iii) and (iv) are true.

Construction procedure $P_{1}$ : Let $\theta$ be a given equivalence relation on a lattice ( $L, \vee, \wedge$ ). Define $x \sim_{1} y$ if there is a finite sequence $\mathrm{x}_{1}, \mathrm{y}_{1}, \mathrm{x}_{1}{ }^{\prime}, \mathrm{y}_{1}{ }^{\prime}, \mathrm{x}_{2}, \mathrm{y}_{2}, \mathrm{x}_{2}{ }^{\prime} \cdot \mathrm{y}_{2}{ }^{\prime}, \ldots \mathrm{x}_{\mathrm{n}}, \mathrm{y}_{\mathrm{n}}, \mathrm{x}_{\mathrm{n}}{ }^{\prime}, \mathrm{y}_{\mathrm{n}}{ }^{\prime}, \ldots$. in L such that $\mathrm{x}_{\mathrm{i}}{ }^{\prime} \equiv \mathrm{x}_{\mathrm{i}}(\bmod \theta)$ and $\mathrm{y}_{\mathrm{i}}{ }^{\prime} \equiv \mathrm{y}_{\mathrm{i}}(\bmod \theta)$, $\forall \mathrm{i}=1,2, \ldots \mathrm{n}$, and such that $\mathrm{x}=\mathrm{x}_{1} \wedge \mathrm{y}_{1}, \mathrm{y}=\mathrm{x}_{\mathrm{n}}{ }^{\prime} \wedge \mathrm{y}_{\mathrm{n}}{ }^{\prime}, \mathrm{x}_{\mathrm{i}}{ }^{\prime} \wedge \mathrm{y}_{\mathrm{i}}{ }^{\prime}=\mathrm{x}_{\mathrm{i}+1}{ }^{\prime} \wedge \mathrm{y}_{\mathrm{i}+1}{ }^{\prime}, \forall \mathrm{i}=1,2, \ldots \mathrm{n}-1$. Then $\sim_{1}$ is an equivalence relation on L. Let us say that $\sim_{1}$ is obtained from $\theta$ by following procedure $P_{1}$. Observe that if $x_{1} \equiv x_{2}(\bmod \theta)$ and $y_{1} \equiv y_{2}(\bmod \theta)$, then $x_{1} \wedge y_{1} \sim_{1} x_{1} \wedge y_{2}$. Note that $\theta \leq \sim_{1}$.
Construction procedure $\mathbf{P}_{2}$ : Replace $\sim_{1}, \mathrm{P}_{1}, \wedge$ in the previous discussion by $\sim_{2}, \mathrm{P}_{2}, \vee$, respectively, so that if $\mathrm{x}_{1} \equiv \mathrm{x}_{2}(\bmod \theta)$ and $\mathrm{y}_{1} \equiv \mathrm{y}_{2}(\bmod \theta)$, then $\mathrm{x}_{1} \wedge \mathrm{y}_{1} \sim \sim_{2} \mathrm{x}_{2} \vee \mathrm{y}_{2}$. Note that $\theta \leq \sim_{2}$.
Construction procedure P3: To each $x \in L$, let $[x]$ denote the equivalence class of a given equivalence relation $\theta$ on a given lattice ( $L, \vee, \wedge$ ). Let us define a relation $\sim_{3}$ on $L$ by $a \sim_{3} b$ if there is a finite sequence $a_{0}, a_{1}, a_{2}, \ldots, a_{n}$ in $L$ such that : (i) $a \equiv a_{0}(\bmod \theta)$; (ii) $b \equiv a_{n}(\bmod \theta)$; and (iii) to each $i=0,1,2, \ldots, n-1$, there are $b_{i}, c_{i} \in\left[a_{i}\right]$ such that $b_{i} \vee c_{i} \in\left[a_{i+1}\right]$ or $b_{i} \wedge c_{i} \in\left[a_{i+1}\right]$; or there are $b_{i+1}, c_{i+1} \in\left[a_{i+1}\right]$ such that $b_{i+1} \vee c_{i+1} \in\left[a_{i}\right]$ or $b_{i+1} \wedge c_{i+1} \in\left[a_{i}\right]$. Then $\sim_{3}$ is an equivalence relation. Let us say that ' $\sim_{3}$ ' is obtained from $\theta$ by following procedure $P_{3}$. Observe that if $b_{0}, c_{0}$ $\in\left[a_{0}\right]$, then $a_{0} \sim 3 b_{0} \vee c_{0}$ and $a_{0} \sim \sim_{3} b_{0} \wedge c_{0}$. Note that $\theta \leq \sim_{3}$.
Construction procedure $\mathbf{P}_{4}$ : Let us fix $L$ and $\theta$, and let us fix the notation [ x$]$ as in the previous procedure. Let us define a relation $\sim_{4}$ on $L$ by $a \sim_{4} b$ if there is a finite sequence $a_{0}, a_{1}, \ldots, a_{n}$ in $L$ such that: (i) $a \equiv a_{0}(\bmod \theta)$; (ii) $b \equiv a_{n}(\bmod \theta)$; and (iii) to each $\mathrm{i}=1,2, \ldots, \mathrm{n}-1$ there are $\mathrm{b}_{\mathrm{i}}, \mathrm{c}_{\mathrm{i}} \in\left[\mathrm{a}_{\mathrm{i}}\right]$ and $\operatorname{di} \in \mathrm{L}$ such that $\left(\mathrm{d}_{\mathrm{i}} \wedge \mathrm{b}_{\mathrm{i}}\right) \vee \operatorname{ci} \in\left[\mathrm{a}_{\mathrm{i}+1}\right]$ or $\left(d_{i} \vee b_{i}\right) \wedge c_{i} \in\left[a_{i+1}\right]$; or there are $b_{i+1}, c_{i+1} \in\left[a_{i+1}\right]$ and $d_{i+1} \in L$ such that $\left(d_{i+1} \wedge b_{i+1}\right) \vee c_{i+1} \in\left[a_{i}\right]$ or $\left(d_{i+1} \vee b_{i+1}\right) \wedge c_{i+1} \in\left[a_{i}\right]$. Then ' $\sim_{4}$ ' is an equivalence relation. Let us say that ' $\sim_{4}$ ' is obtained from $\theta$ by following procedure $\mathrm{P}_{4}$. Observe that if $\mathrm{b}_{0}, \mathrm{c}_{0} \in\left[\mathrm{a}_{0}\right]$ and $\mathrm{d}_{0} \in \mathrm{~L}$, then $\mathrm{a}_{0} \sim_{4}\left(\mathrm{~d}_{0} \vee \mathrm{~b}_{0}\right) \wedge \mathrm{c}_{0}$ and $\mathrm{a}_{0} \sim_{4}\left(\mathrm{~d}_{0} \wedge \mathrm{~b}_{0}\right) \vee \mathrm{c}_{0}$. Note that $\theta \leq \sim_{4}$.

Theorem 3.2 Let $\theta_{0}$ be a given equivalence relation on a lattice ( $L, \vee, \wedge$ ). Let $\theta_{\beta}$ be the stationary equivalence relation obtained by following the procedures $\mathrm{P}_{1}, \mathrm{P}_{2}, \mathrm{P}_{3}, \mathrm{P}_{4}$ on $\theta_{0}$. Then $\theta_{\beta}$ is the smallest congruence relation on $L$ such that $\theta_{0} \leq \theta_{\beta}$. Proof: To each $x \in L$, let $[x]$ denote the equivalence class of $\theta_{\beta}$ containing $x$. The procedure $\mathrm{P}_{1}, \mathrm{P}_{2}, \mathrm{P}_{3}$, and $\mathrm{P}_{4}$ reveal that the conditions (i),(ii),(iii) and (iv) of the previous lemma 3.1 are satisfied for the equivalence relation $\theta_{\beta}$ on $L$. $\operatorname{So}, \theta_{\beta}$ is a congruence relation on $L$ such that $\theta_{0 \leq} \theta_{\beta}$.

## IV. Equivalence relation to closed congruence relation

This section provides a construction to obtain a smallest closed equivalence relation $\theta^{\prime}$ from a given equivalence relation $\theta$ such that $\theta \leq \theta^{\prime}$ on a lattice. This construction may be combined with the construction of the previous section to obtain a smallest closed congruence relation. Let us introduce some notations for the next construction. Let $\theta$ be an equivalence relation in a given lattice $L$. If $K_{1}, K_{2}$ are subsets of two equivalence classes of $\theta$, then let us write $\mathrm{K}_{1} \equiv \mathrm{~K}_{2}(\bmod \theta)$ if $\mathrm{K}_{1}, \mathrm{~K}_{2}$ are subsets of the same equivalence class of $\theta$, then let us
write $x \equiv K(\bmod \theta)$ if $x \equiv y(\bmod \theta), \forall y \in K$. If $K$ is a subset of $L$ and if a least upper bound of $K$ exists in $L$, then it will be denoted by $\vee \mathrm{K}$. The notation $\wedge \mathrm{K}$ refer to a greatest lower bound on K , when it exists.
Construction procedure $\mathbf{P}_{5}$ : Let $\theta$ be a given equivalence relation on a lattice ( $L, \vee, \wedge$ ). Let $\aleph$ be a fixed infinite cardinal number. Let us write $\mathrm{H} \sim \mathrm{K}$ for two non empty subsets $\mathrm{H}, \mathrm{K}$ of equivalence classes of $\theta$, when there is a finite sequence $G_{0}, G_{1}, \ldots, G_{n}(n \geq 1)$ of subsets of equivalence classes of $\theta$ such that:
(i) $\mathrm{H} \equiv \mathrm{G}_{0}(\bmod \theta)$,
(ii) $\mathrm{K} \equiv \mathrm{G}_{\mathrm{n}}(\bmod \theta)$,
(iii) $\left|\mathrm{G}_{\mathrm{i}}\right|<\aleph, \forall \mathrm{i}=1,2, \ldots, \mathrm{n}$.
(iv) $\vee G_{i}$ exists and $\vee G_{i} \equiv G_{i+1}(\bmod \theta)$ or $\wedge \mathrm{G}_{\mathrm{i}}$ exists and $\wedge \mathrm{G}_{\mathrm{i}} \equiv \mathrm{G}_{\mathrm{i}+1}(\bmod \theta)$ or $\vee \mathrm{G}_{\mathrm{i}+1}$ exists and $\vee \mathrm{G}_{\mathrm{i}+1} \equiv \mathrm{G}_{\mathrm{i}}(\bmod \theta)$ or $\wedge \mathrm{G}_{\mathrm{i}+1}$ exists and $\wedge \mathrm{G}_{\mathrm{i}+1} \equiv \mathrm{G}_{\mathrm{i}}(\bmod \theta)$, for $\mathrm{i}=1,2, \ldots, \mathrm{n}-1$.
The following can be verified.
(i) If $x \equiv y(\bmod \theta)$, then $[x] \sim[y]$. For take $n=1, G_{0}=H=\{x\}$ and $G_{1}=K=\{y\}$ in the previous description.
(ii) Let H be a subset of an equivalence class of $\theta$ such that $|\mathrm{H}|<\aleph$.

If $\vee H$ exists, then $H \sim\{\vee H\}$. For, take $n=1, G_{0}=H$, and $G_{1}=K=\{\vee H\}$ in the previous description. Similarly, if $\wedge H$ exists, then $H \sim\{\wedge H\}$.

Let us now define ' $\sim_{5}$ ' on $L$ by $x \sim_{5} y$ if $[x] \sim[y]$, when $x, y \in L$. This defines an equivalence relation on L such that $\theta \leq \sim_{5}$. Let us say that ' $\sim_{5}$ ' is obtained from $\theta$ by following the procedure $\mathrm{P}_{5}$. The properties (i) and (ii) of ' $\sim 5$ ' imply the next theorem 4.1.

Theorem 4.1 Let $\theta_{0}$ be a given equivalence relation on a lattice ( $L, \vee, \wedge$ ). Let $\aleph$, be a given infinite cardinal number. Let $\theta_{\beta}$ be the stationary equivalence relation obtained by following the procedure $\mathrm{P}_{5}$ on $\theta_{0}$. Then $\theta_{\beta}$ is the smallest $\aleph$-closed equivalence relation on $L$ such that $\theta_{0} \leq \theta_{\beta}$.

The next theorem 4.2 is a combination of Theorem 3.2 and Theorem 4.1.
Theorem 4.2 Let $\theta_{0}$, $(\mathrm{L}, \vee, \wedge)$ and $\aleph$ be as in the previous theorem 4.1. Let $\theta_{\beta}$ be the stationary equivalence relation obtained by following the procedures $\mathrm{P}_{1}, \mathrm{P}_{2}, \mathrm{P}_{3}, \mathrm{P}_{4}, \mathrm{P}_{5}$ on $\theta_{0}$. Then $\theta_{\beta}$ is the smallest $\aleph$-closed congruence relation on $L$ such that $\theta_{0} \leq \theta_{\beta}$.

Remark 4.3 If $\left(\theta_{\mathrm{i}}\right)_{\mathrm{i} \in \mathrm{I}}$ is a collection of equivalence relations on a lattice $(\mathrm{L}, \vee, \wedge)$, then one can follow an usual procedure (see theorem 4.3 in p .23 in [1]) to construct a smallest equivalence relation $\theta_{0}$ such that $\theta_{\mathrm{i}} \leq \theta_{0}, \forall \mathrm{i} \in \mathrm{I}$ If $\theta_{\beta}$ is the congruence relation constructed in the theorem 4.2 , then $\theta_{\beta}$ is the smallest $\aleph$-closed congruence relation such that $\theta_{\mathrm{i}} \leq \theta_{\beta}, \mathrm{i} \in \mathrm{I}$.

Remark 4.4 The word ' $\aleph$-closed' may be replaced by the word 'closed' in the discussion of this section.
