5. Department of Biotechnology, Andhra University, Waltair. India.

Abstract
Objective: In this study the potency of antibacterial activities of crude organic solvent extracts ethyl acetate, dichloromethane, and methanol extracts of Knoxia corymbosa were tested on bacterial pathogens Escherichia coli, Klebsiella pneumonia, Staphylococcus aureus, Streptococcus pneumonia, Bacillus subtilis and the potency of antifungal activities of crude organic solvent extracts ethyl acetate and methanol extracts were tested on fungal pathogens Aspergillus niger and Candida albicans.

Key words: Anti-bacterial activity, Anti-fungal activity, Potato dextrose agar (PDA), Streptomycin sulphate.

I. Introduction
The ethno medical and ethno botanical uses of the plants are completely crude uses of plants parts like leaves, roots, stem, bark etc. But the chemical analysis intended to find out to the chemical substances, which is responsible for the medicinal effect. So this is an interdisciplinary subject. A lot of work has been going on this way throughout the globe. In Andhra University a significant work has been going on. Ayurveda, the ancient healing system of India, flourished in the Vedic Era in India. According to historical facts, the classical texts of Ayurveda, Charaka Samhita and Sushruta Samhita were written around 1000B.C.The Ayurvedic Materia Medica includes 600 medicinal plants along with therapeutics. Herbs like turmeric, fenugreek, garlic and holy basil are integral part of Ayurvedic formulations. The formulations incorporate single herb or more than two herbs (poly-herbal formulations). Knoxia corymbosa is an erect perennial herb Family Rubeacea mostly 40-90 cm tall. Stems are little-branched, velvety. Leaves are narrow-lance shaped to ovate, mostly 2.5-8 cm long, 0.8-3.5 cm wide, tip pointed to long-pointed, base wedge-shaped to flat, margins with fine hairs. Both surfaces of the leaves are velvety, and the leaf-stalk is 3-10 mm long. Flowers are borne in a dense, cyme up to 4 cm long, carried on a 0.2-2.5 cm long stalk, at the end of branches. Flowers stalks are 0.5-1 mm long. Flowers are usually 1.5-2 mm long, purplish blue or rarely white. Anthers protrude out. Fruit is ellipsoid about 1.5-2 mm long, crowned by sepals, usually falling entire. Knoxia corymbosa is found in Indo-Himalaya region, peninsular India and Sri Lanka. Flowering: September-October. Knoxia corymbosa is assumed to containing some medicinal values because some authors reported that they isolated some chromone glycosides. Knoxia valerianoides is a Knoxia species from which an herbal medicine is responsible for the medicinal effect. So this is an interdisciplinary subject.

II. Materials And Methods:

Collection Of Plant Material:
Fresh plants of Knoxia corymbosa free from disease were collected from Y.Ramavaram of Addatheeagala, virgin forests of Bison hills of East Godavari District Andhra Pradesh India. Location coordinates of Y.Ramavaram are 17.48330N and 82.01670C. Plant identification was verified by M.Ravikumar of Department of Botany V.S.M college Ramachandrapuram.The plants were washed thoroughly 2-3 times with running water and finally once with sterile distilled water. The plant material was then air dried on sterile blotter under shade for 5 days and then powdered with the help of a blender.

Solvent Extraction:
25gm of shade dried powder was filled in the thimble and extracted successively with Methanol, Ethyl acetate, Dichloromethane solvents in soxhlet extractor for 48 hours. The solvent extracts were concentrated under pressure and preserved at 4°C in an airtight bottle for further use.
Growth and Maintenance of Bacterial and Fungal Cultures for Antimicrobial studies:
The lyophilized forms of different strains of microorganisms like Escherichia coli [MTCC-2126], Staphylococcus aureus [MTCC-3160], were obtained from the Microbial Type Culture Collection and Gene bank (MTCC), Chandigarh, India and the bacterial Strains Streptococcus faecalis [NCIM-2603] and Streptococcus pyogenes. Bacillus subtilis [NCIM-2655] were obtained from National Collection of Industrial Microorganisms (NCIM), Pune, India.

Preparation Of Inoculum For Anti Microbial Studies:
The Gram positive (Staphylococcus aureus, Staphylococcus pneumonia and Bacillus subtilis) and Gram negative (Escherichia coli and Klebsiella pneumonia) bacteria were precultured in Nutrient Broth over night in a Rotary shaker Incubator at 370C, the culture broth was centrifuged at 10,000rpm for 5minutes, pellet was suspended in double distilled water and the cell density was standardized Spectrophotometrically (A610nm). The fungal inoculum for Aspergillus Niger was prepared from 5-10day old culture grown on Potato Dextrose Agar medium the petri dishes were flooded with 10ml of distilled water and the conidia were scrooped with a sterial spatuala. The spore density of each fungus was adjusted with spectrophotometer (A 595nm) to obtain final concentration of approximately 105 spores per ml

Method: Antibacterial activity of isolated crude organic solvent extracts ethyl acetate, dichloromethane and methanol extracts of Knoxia corymbosa was checked by agar well diffusion method.

Anti Bacterial Activity Assay:
The Gram positive bacteria Staphylococcus aureus, Staphylococcus pneumonia and Bacillus subtilis and Gram negative bacteria Escherichia coli and Klebsiella pneumonia were tested for their susceptibility to extracts of Knoxia corymbosa by disc diffusion method. Crude organic solvent extracts of Knoxia corymbosa were prepared for antimicrobial assays by reconstituting with the respective organic solvents. The test bacteria were seeded into Mueller Hinton agar medium Spread plate method10μg (106cells/ml) with overnight grown cultures of Bacteria in Nutrient broth. The Filter paper discs 5mm in diameter impregnated with 5μg/ml-1 of the crude organic solvent extracts were placed on test organism seeded plates were used for the antibacterial tests. Streptomycin sulphate (10μg /ml-1) was used as positive control and the organic solvents were used as negative control. The antibacterial assay plates in triplicates were incubated at 370C for 24 hrs. The diameters of the inhibition Zones were measured in mm.

Anti Fungal Activity assay:
Aspergillus niger and Candida albicans were tested for their susceptibility to crude organic solvent extract of Knoxia corymbosa. The antifungal activity was tested by disc diffusion method. The Potato Dextrose Agar plates were inoculated with each fungal culture (10 days old) by point inoculation. The filter paper discs (5mm in diameter) impregnated with 5μg/ml-1 concentrations of the crude organic solvent extracts were placed on test organism seeded plates. The respective organic solvents were used to dissolve the extract and was completely evaporated before application on test organism seeded plates. A blank disc impregnated with the respective organic solvent followed by drying off was used as negative control and the fungicide Nystatin (10μg/ml-1) was used as positive control. The activity was determined after 72 hrs of incubation at 280C. The diameters of the clear inhibition zones were measured in mm.

III. Results And Discussion:
Ethyl acetate extract showed antibacterial activity against a total of five bacterial strains Escherichia coli, Klebsiella pneumonia, Staphylococcus aureus, Streptococcus pneumonia, Bacillus subtilis and antifungal activity against a fungal species Aspergillus niger. Dichloromethane extract doesn’t show any antimicrobial and antifungal activity. Methanol extract showed antibacterial activity against three bacteria strains Staphylococcus aureus, Streptococcus pneumonia, Escherichia coli and antifungal activity against Aspergillus niger.

IV. Conclusion

Plants are the natural sources to promote health, from the present study it can be concluded that the antibacterial activity of Knoxia corymbosa leaf extracts of Ethyl acetate, dichloromethane, and methanol extracts are effective against various gram positive organisms and gram negative organisms and antifungal activity against fungal organism. Extensive studies are to be carried out to find out which of the chemical constituent might be responsible for antibacterial activity and antifungal activity. Finally Knoxia corymbosa may be useful to various other diseases also; further investigation need to be done for this.
