#### Abstract

$C u(I)$ catalysed 1,3-dipolar cycloaddition combination of azide and alkyne yielded a novel chemical series of [1,2,3]-triazole containing benzoxazine derivatives. In vitro testing of the produced drugs for antibacterial activity revealed that compounds $6 a, 6 i, 6 j$ and $6 k$ are effective antibacterial agents. Among these four compounds are the most common 3-((1-(3-chlorophenyl)-1H-1,2,3-triazol-4-yl)methyl)-2,2-dimethyl-2,3-dihydro-4H-benzo[e] [1,3] oxazin-4-one (6j) compound has shown the most powerful antibacterial action against gram negative and gram positive bacterial strains tested.

Keywords: 1,3-Benzoxazin-4-one, 1,2,3-triazole,in vitro antibacterial activity

## I. Introduction

Derivative products of Benzoxazines are the most important nitrogen and oxygen-containing heterocyclic compounds, and 1,3 benzoxazines and their derivatives have attracted the attention of both synthetic and medicinal chemists due to its convenience of synthesis, lack of exploration, and rarity in natural products when compared to other benzoxazine isomers. At the same time, 1,3 benzoxazines are the core structure for a wide range of biological active chemicals, including anticancer ${ }^{1}$, antimicrobial ${ }^{2}$, antifungal ${ }^{3}$, antiplatelete ${ }^{4}$, antihypertensive ${ }^{5}$, antithelmentic ${ }^{6}$, vasorelaxing ${ }^{7}$, potassium channel modulating ${ }^{8}$, herbicidal ${ }^{9}$, and fungicidal ${ }^{10}$ agents. 1,2,3-triazole are essential pharmacophere for drug development ${ }^{11,12}$ for Analgesic ${ }^{13}$, antiinflammatory ${ }^{14,15}$, antiviral ${ }^{16}$, antimicrobial ${ }^{17}$, antifungal ${ }^{18}$, antibacterial ${ }^{19}$, antitubercular ${ }^{20}$, and antitumor ${ }^{21}$ because they demonstrated considerable biological action.

Molecular hybridization, but in the other hand, is the most recent and effective technique in modern drug discovery $y^{22}$. Which entails combining active pharmacophores from two or more physiologically active compounds into a single moiety in order to create a novel hybrid with higher efficiency and affinity than the original drug ${ }^{23}$. Furthermore, these hybrids can function more selectively and specifically than the parent medicines, with less adverse effects ${ }^{24}$. We present here the unique synthesis of [1,2,3]-triazole containing 1,3-benzoxazine-4-one derivatives and their evaluation as antibacterial agents as part of our focus in the creation of novel bioactive hybrids.

## II. Material And Meathod

## Instrumentation and Chemicals General experimental methods

Every one of the chemicals we used in the processes were Laboratory Grade, which meant they could be used without further purification. A Veego softening point device was used to determine the melting points of the produced compounds. TLC plates were used to assess the purity of the produced compounds, using silica F254 (adsorbent) covered on aluminium plates (Merck), UV lamp, and iodine vapours used as visualising agents. Spectra were recorded using a Varian mercuryTH- 300 spectrometer at 400 MHz for 1 H NMR and 101.6 MHz for 13C NMR using deuterated solvents like CDCl 3 and DMSO-d6 as well as Tetramethylsilane (TMS) as an internal standard and chemical shifts were measured in ppm .

## CHEMISTRY

## III. Results And Descussion

The current research mostly focuses on the design of unique models. -((1-(3-chlorophenyl)-1H-1,2,3-triazol-4-yl)methyl)-2,2-dimethyl-2,3-dihydro-4H-benzo[e][1,3]oxazin-4-onehybrids, using commercially available 2-hydroxybenzamidel as the starting material. Initially, the coupling partner alkynes3abwassynthesized from 2-hydroxybenzamide1in two phases, in the first step \s2-hydroxybenzamide1 treated with two distinct ketones to produce $2 \mathbf{a}-\mathbf{b}$ in good yields. In the second stage, the NH group in $2 \mathbf{a}-\mathbf{b}$ is propargylated using propargyl bromide and anhydrous K2CO3/DMF to produce propargyl-benzoxazines 3a-b (Scheme 1). As indicated in Scheme 2, the coupling partnerazides5a-f were synthesised utilising the matching amines $4 \mathbf{a}-\mathbf{f}$. Finally, the Click reaction was used in the critical step to synthesise target hybrid compounds, as shown in Scheme 1. The reaction of coupling partner azides5a-f with propargyl-benzoxazines 3a-b in DMF with a catalytic quantity of $\mathrm{CuSO}_{4} 5 \mathrm{H}_{2} \mathrm{O}$ and Sodium ascorbate provides related benzoxazine-4-substituted-1,2,3triazole hybrids6a-l as final hybrid compounds in high yields. Using ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR, and Mass Spectral analysis, each synthesised hybrid molecule was thoroughly characterised.

## Scheme-I

Scheme 2. Synthesis of azide partners 5a-f.

Table-I
Compound

Synthesis of 2,2-dimethyl-3-(prop-2-yn-1-yl)-2,3-dihydro-4H-benzo[e][1,3]oxazin-4-one (3a)
Powdered $\mathrm{K}_{2} \mathrm{CO}_{3}(11.69 \mathrm{~g}, 8.47 \mathrm{~mol})$ was added to a solution of 2,2-dimethyl-2,3-dihydro-4H-benzo[e][1,3]oxazin-4-one ( $\mathbf{2 a}$ ) ( $5.0 \mathrm{~g}, 2.82 \mathrm{~mol}$ ) in DMF ( 20 mL ) followed by addition of 3- bromoprop-1-yne $(2.14 \mathrm{~mL}, 2.82 \mathrm{~mol})$ and the reaction mixture was stirred at $80^{\circ} \mathrm{C}$ for $4-8 \mathrm{~h}$ completion reaction was confirmed by TLC, cool the reaction mixture to rt, diluted with $\mathrm{H}_{2} \mathrm{O}(30 \mathrm{~mL})$, and extracted with EtOAc $(3 \times 50 \mathrm{~mL})$. The EtOAc layers were mixed, dried with $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated. Flash chromatography was used to purify the crude mass, yielding 2,2-dimethyl-3-butanediol (prop-2-yn-1-yl) 4,3-dihydro-4H-benzo[e][1,3]oxazin-4-one -2,3-dihydro-4H-benzo[e][1,3]oxazin-4-one (3a).

## Synthesis of 3-(prop-2-yn-1-yl)spiro[benzo[e][1,3]oxazine-2,1'-cyclohexan]-4(3H)-one(3b)

2-spiro[benzo[e][1,3]oxazine-2,1'-cyclohexan] is added to a solution of 2-spiro[benzo[e][1,3]oxazine-2,1'-cyclohexan] $-4(3 \mathrm{H})$-one $(2 \mathrm{~b})(5.0 \mathrm{~g}, 2.30 \mathrm{~mol})$ in DMF ( 20 mL ) was added followed by powdered $\mathrm{K}_{2} \mathrm{CO}_{3}$ $(9.53 \mathrm{~g}, 6.91 \mathrm{~mol})$ in DMF ( 20 mL ) and the reaction mixture was stirred at $80^{\circ} \mathrm{C}$ for $4-8 \mathrm{~h}$ completion reaction was confirmed by TLC, cool the reaction mixture to rt, diluted with $\mathrm{H} 2 \mathrm{O}(30 \mathrm{~mL})$, and extracted with EtOAc $(3 \times 50 \mathrm{~mL})$. The EtOAc layers were mixed, dried with $\left(\mathrm{MgSO}_{4}\right)$, filtered, and concentrated. Flash chromatography was used to purify the crude mass, yielding 3-(prop-2-yn-1-yl)spiro[benzo[e][1,3]oxazine-2,1'cyclohexan]. $-4(3 \mathrm{H})$-a single ( $\mathbf{3 b}$ ).

General procedure for the preparation of 3-((1-(3-chlorophenyl)-1H-1,2,3-triazol-4-yl)methyl)-2,2-dimethyl-2,3-dihydro-4H-benzo[e][1,3]oxazin-4-one (6a-1)

The synthetic route for the key intermediate compound (3a-b) were started with 2,2-dimethyl-3-(prop-$2-y n-1-y l)-2,3$-dihydro-4H-benzo[e][1,3]oxazin-4-one and 3-(prop-2-yn-1-yl)spiro[benzo[e][1,3]oxazine-2,1'cyclohexan] $-4(3 \mathrm{H})$-one ( $3 \mathrm{a}-\mathrm{b}$ ) was reacted with different aryl azides ( $4 \mathrm{a}-\mathrm{c}$ ) using Click chemistry in CuSO4.5H2O with sodium ascorbate to form 3-((1-(3-chlorophenyl)-1H-1,2,3-triazol-4-yl)methyl)-2,2-dimethyl-2,3-dihydro-4H-benzo[e][1,3]oxazin-4-one (4a-l).

## IV. Antibacterial Activity

Inoculation of Staphylococcus aureus (gram-positive), Escherichia coli (E. coli) (gram-negative), Bacillus subtilis (gram-positive), Pseudomonas aeruginosa (gram-negative), and all microorganisms acquire from Microbial Type Culture Collection - MTCC. In auto calved LB stock media and Incubate for the time being at $37^{\circ} \mathrm{C}$ in a shaker for Bacterial development. From that, 0.3 mL of bacterial culture was taken and immunized utilizing spreader on newly pre-arranged auto calved agar plates, i.e., Petri dishes. Subsequent to drying the plates, a $5-\mathrm{mm}$ test circle, which was broken down in DMSO dissolvable, was kept on microbial plate alongside certain controls NX (Norfloxacin), which were incubated for the time being at $37^{\circ} \mathrm{C}$ in BOD incubators. Later short-term incubate, zone of hindrance is estimated utilizing an estimating scale.

| Hybrid <br> compounds | Bacterial strain <br> (Gram positive) |  | Bacterial strain <br> (Gram negative) |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Bacillus <br> subtilis | Staphylococcus <br> aureus | Pseudomonas <br> aeruginosa | Escherichia <br> coli |
| $\mathbf{6 a}$ | 4.0 | 4.3 | 3.9 | 4.1 |
| $\mathbf{6 b}$ | - | - | - | - |
| $\mathbf{6 c}$ | - | - | - | - |
| $\mathbf{6 d}$ | 3.2 | - | - | 4.3 |
| $\mathbf{6 e}$ | - | - | - | - |
| $\mathbf{6 f}$ | 3.0 | 3.2 | - | - |
| $\mathbf{6 g}$ | 3.1 | - | - | - |
| $\mathbf{6 h}$ | - | - | - | - |
| $\mathbf{6 i}$ | 3.4 | 4.0 | 4.1 | 3.7 |
| $\mathbf{6 j}$ | 5.1 | 5.4 | 5.5 | 4.7 |
| $\mathbf{6 k}$ | 4.1 | 4.5 | 3.2 | 3.8 |
| $\mathbf{6 l}$ | 3.8 | 3.5 | - | - |
| Norfloxacin | 6.2 | 6 | 6.4 | 7 |
| ${ }^{a}$ Zone of inhibition $(\mathrm{mm}) 10 \mu \mathrm{~g} / \mathrm{mL}$ concentrations |  |  |  |  |

Each synthesized hybrid compound was tested in vitro for antibacterial activity against two different gram-positive bacteria strains [B. subtilis; S. aureus] and two different gram-negative bacteria strains [P. aeruginosa; E. coli]. IMT, Chandigarh provided the strains used in the biological activities. The culture media used in the tests were stored on supplement agar (bacterial) subculture in Petri dishes prior to testing. The resulting compounds were evaluated using DMSO as a dissolvable solvent at a concentration of $10 \mathrm{mg} / \mathrm{mL}$. The inhibitory zone (in mm ) was compared to that of the conventional antibiotic Norfloxacin. Table 1 summarizes the findings. Every created hybrid compound $\mathbf{6 a}, \mathbf{6 i}, 6 \mathbf{j}$, and $6 \mathbf{k}$ demonstrated a bright zone of inhibition against the P. aeruginosa bacterial strain, and these mixes also shown excellent bacterial activity. Against E. coli, compound 6a showed a 3.9 mm zone of impediment, all of the remaining hybrid compounds showed moderate antibacterial activity against the E. coli bacterial strain.

## V. Conclusion

In this study, a series of 1,3 benzoxazines linked 1,2,3-triazoles ( $6 \mathbf{a}-\mathrm{l}$ ) were successfully synthesized in good yields by cyclization of 2-hydroxy benzamide with ketones followed by click chemistry. The antibacterial activity of the compounds was evaluated and compound ( $\mathbf{6} \mathbf{j}$ ) was found to be the most active among the tested compounds.
