# An approach to Jordan canonical form of similarity 

Shibaji Halder<br>Vidyasagar College, Department of Mathematics, Kolkata-6, West Bengal, India.

#### Abstract

Every linear transformation on a finite dimensional vector space gives different matrix representation w.r.t different basis. But as they are representation of same linear transformation. Therefore all the matrix representation of the transformation must have common properties of the transformation and must have a canonical representation. Here it is found out such canonical form when the field is algebraically closed. If eign vectors of the transformation can span the vector space, then canonical form will be diagonal matrix with eign values are diagonal elements. But if they not span the vector space, then using two famous well-known theorems (1) Primary Decomposition theorem and (2) Cyclic Decomposition theorem we get the famous Jordan Canonical Form which is the simplest representation of the linear transformation for algebraically closed field.

Keywords-Linear transformation, Primary Decomposition, Cyclic decomposition, Jordan Canonical form.

## I. Introduction

Every linear transformation over a finite dimensional vector space over a field represents by a similar class of matrices with respect to different bases. We want to find a canonical form of similarity. When eign vectors span the vector space then canonical form be diagonal matrix but we want to find when they can not span the vector space. Here we find a unique collection of subspaces, direct sum of which is the given vector space and the subspaces spanned by bases which can constructed form eign vectors.

## II. General Discussion

With respect to different basis on $V_{n}$ over $F$ each linear transformation $T$ represents different matrices. Thus the same similarity class must share in common those properties of T that are independent of the choice of basis and therefore are valid in any coordinate system. Thus we find a basis under which T is expressed in the simplest possible way. i.e. canonical matrix representation. Thus we find out such non zero vectors of $\mathrm{V}_{\mathrm{n}}$ that are mapped by T in the simplest possible form. Here it is found out such canonical form when the field is algebraically closed. If eign vectors of the transformation can span the vector space, then canonical form will be diagonal matrix with eign values are diagonal elements. But if they not span the vector space, then using two famous wellknown theorem (1) Primary Decomposition theorem and (2) Cycilc Decomposition theorem we get the famous Jordan Canonical form. Now we are starting with to find out such vectors of V that are mapped by T into scalar multiple of itself. i.e.parallel to itself. i. e. $T \xi=\lambda \xi$ for some scalar $\lambda$. If $B$ is any ordered basis of $V_{n}$ and $A=[T]_{B}$ and $X$ be the coordinate of the vector, then $A X=\lambda X,(A-\lambda I) X=0$, As we want a basis, i. e. some non zero vectors, $\therefore|A-\lambda I|=0$. The roots $\lambda_{i}$ of this equation are called eign value and corresponding non zero vectors $X_{i}$ are called eign vectors for the eign value $\lambda_{i}$.
If corresponding to all eign values we get $n$ linearly independent vectors, then they form a basis of $V_{n}$. i.e. w.r.t the basis $\left\{X_{1} X_{2}, \ldots \ldots, X_{n}\right\}$ the matrix representation of $T$ will be the simplest form and which will be

$$
\left(\begin{array}{ccccc}
\lambda_{1} & 0 & \cdot & \cdot & 0 \\
0 & \lambda_{2} & \cdot & \cdot & 0 \\
\cdot & \cdot & \cdot & \cdot & \cdot \\
\cdot & \cdot & \cdot & \cdot & \cdot \\
0 & 0 & \cdot & \cdot & \lambda_{k}
\end{array}\right) \quad \text { where } \mathrm{k} \leq \mathrm{n}
$$

Again the subspace $w\left(\lambda_{i}\right)$ form by the eign vectors corresponding to $\lambda_{i}$ be $T$ invariant and in this case,

$$
\mathrm{V}_{\mathrm{n}}=\mathrm{w}\left(\lambda_{1}\right) \oplus \mathrm{w}\left(\lambda_{2}\right) \oplus \ldots \ldots \ldots \oplus \mathrm{w}(\mathrm{k}) .
$$

Thus we are now in a stage where we not consider the whole space, only to consider the subspaces, direct sum of gives the total space and the union of the basis of the subspaces gives the basis of $V_{n}$. Therefore action of $T$ on the whole space is the sum of the action of $T$ on the subspaces.
But there arises two problems

1. F is not algebraically closed.i.e. characteristic polynomial does not factors completely over F into a product of polynomials of degree one.
2. Even if (1) is possible, there may not be enough characteristic vectors for $T$ to span $V_{n}$.

Now we state another direct sum decomposition of $V_{n}$, called Primary Decomposition theorem. Which states that, if $p$ be minimal polynomial of $T$,

$$
\mathrm{p}=\mathrm{p}_{1}{ }^{\mathrm{r}_{1}} \mathrm{p}_{2}{ }^{\mathrm{r}_{2}} \ldots \ldots \ldots \ldots \ldots . \mathrm{p}_{\mathrm{k}}{ }^{\mathrm{r}_{\mathrm{k}}}
$$

where $p_{i}$ are distinct irreducible monic polynomials over $F$ and $r_{i}$ are positive integers. If $w_{i}$ be the null space of $p_{i}(T)^{r_{i}}$. Then

1. $\mathrm{V}_{\mathrm{n}}=\mathrm{W}_{1} \oplus \mathrm{~W}_{2} \oplus \ldots \ldots \oplus \mathrm{~W}_{\mathrm{k}}$
2. Each $\mathrm{W}_{\mathrm{i}}$ is invariant under T ;
3. If $T_{i}$ is the operator induced on $W_{i}$ by $T$, then minimal polynomial for $T_{i}$ is $p_{i}{ }^{r_{i}}$.

But here it is difficult to find the basis of $\mathrm{W}_{\mathrm{i}}$. Now we state another decomposition on $\mathrm{V}_{\mathrm{n}}$, called Cyclic decomposition theorem and with the help of this two theorem we shall show that if F is algebraically closed then there exist a basis under which T is represented in the simplest possible way. Now Cyclic Decomposition theorem says that, If T be a linear operator on a finite dimensional vector space V and $\mathrm{W}_{0}$ be a proper $T$ admissible subspace of V . Then there exist nonzero vectors $\alpha_{1}, \alpha_{2}, \ldots \ldots, \alpha_{r}$ in $V$ with respective $\mathrm{T}-$ annihilators $\mathrm{p}_{1}, \mathrm{p}_{2}, \ldots . ., \mathrm{p}_{\mathrm{r}}$ such that

1. $\quad V=W_{0} \oplus Z\left(\alpha_{1}, T\right) \oplus Z\left(\alpha_{2}, T\right) \oplus \ldots \ldots . . Z\left(\alpha_{r}, T\right)$
2. $\mathrm{p}_{\mathrm{k}}$ devides $\mathrm{p}_{\mathrm{k}-1}$ for all $\mathrm{k}=2$, ..,..r.

Furthermore, the integer $r$ and the annihilators $p_{1}, p_{2}, \ldots, p_{r}$ are uniquely determined and the fact that no $\alpha_{k}$ is zero. If we take $W_{0}=\{0\}$, Then $V=Z\left(\alpha_{1}, T\right) \oplus Z\left(\alpha_{2}, T\right) \oplus \ldots \ldots . . Z\left(\alpha_{r}, T\right)$.
Now with the help of this above two theorems we develop the canonical form and the corresponding basis for algebraically closed field.
Let the characteristic polynomial be,
$\mathrm{f}=\left(\mathrm{x}-\lambda_{1}\right)^{\mathrm{d}_{1}}\left(\mathrm{x}-\lambda_{2}\right)^{\mathrm{d}_{2}} \ldots \ldots \ldots . .\left(\mathrm{x}-\lambda_{\mathrm{k}}\right)^{\mathrm{d}_{\mathrm{k}}}$ where $\lambda_{1}, \lambda_{2}, \ldots \ldots \lambda_{\mathrm{k}}$ are
distinct elements of $F$. Then the minimal polynomial for $T$ be,
$p=\left(x-\lambda_{1}\right)^{r_{1}}\left(x-\lambda_{2}\right)^{r_{2}} \ldots \ldots \ldots . .\left(x-\lambda_{k}\right)^{r_{k}}$ where $1 \leq r_{i} \leq d_{i}$
If $W_{i}$ be the null space of $\left(T_{i}-\lambda_{1} I\right)^{r_{i}}$, Then by primary decomposition theorem

$$
\mathrm{V}_{\mathrm{n}}=\mathrm{W}_{1} \oplus \mathrm{~W}_{2} \oplus \ldots \ldots \oplus \mathrm{~W}_{\mathrm{k}}
$$

and the operator $T_{i}$ induced on $W_{i}$ by $T$ has minimal polynomial $\left(x-\lambda_{i}\right)^{r_{i}}$. Then $N_{i}=T_{i}-\lambda_{i} I$, is nilpotent on $W_{i}$ and has minimal polynomial $x^{r_{i}}$. Now by cyclic decomposition there exist $R_{i}$ non zero vectors $\alpha_{i 1}, \alpha_{i 2}, \ldots \ldots \alpha_{i R_{i}}$ of $W_{i}$ such that $V=Z\left(\alpha_{i 1}, N_{i}\right) \oplus Z\left(\alpha_{i 2}, N_{i}\right) \oplus \ldots \ldots . . Z\left(\alpha_{i R_{i}}, N_{i}\right)$ with unique $N_{i}$ - annihilators $p_{i 1}, p_{i 2}, \ldots \ldots \ldots, p_{i R_{i}}$ and each $p_{i j}=x^{k_{i j}}\left(j=1,2, \ldots . ., R_{i}\right)$ s.t. $k_{i 1}=r_{i} \geq k_{i 2} \geq \cdots \geq k_{i R_{i}}$ Again it can be shown that the $R_{i}$ vectors $\left\{N_{i}{ }^{k_{i 1}-1} \alpha_{i 1}, N_{i}{ }^{k_{i 2}-1} \alpha_{i 2}, N_{i}{ }^{k_{i 1}-1} \alpha_{i 1}, \ldots \ldots \ldots \ldots \ldots . N_{i}{ }^{k_{i R_{i}}-1} \alpha_{i R_{i}}\right\}$ form the basis of the null space of $N_{i}=T_{i}-\lambda_{i} I$.i. e. eign vectors corresponding to the eign value $\lambda_{i}$ of $T_{i}$. Taken $\left\{\xi_{\mathrm{i} 1}, \xi_{\mathrm{i} 2}, \ldots \ldots, \xi_{\mathrm{iR}_{\mathrm{i}}}\right\}$ as eign vectors corresponding to the eign value $\lambda_{\mathrm{i}}$.
Then we take $N_{i}{ }^{k_{i 1}-1} \alpha_{i 1}=\xi_{i 1} \Rightarrow N_{i}^{k_{i 1}} \alpha_{i 1}=N_{i} \xi_{i 1}=\left(T_{i}-\lambda_{i} I\right) \xi_{i 1}=0$.
$\therefore \mathrm{N}_{\mathrm{i}}{ }^{\mathrm{k}_{\mathrm{i} 1}} \alpha_{\mathrm{i} 1}=0$. thus the set $\left\{\alpha_{\mathrm{i} 1}, \mathrm{~N}_{\mathrm{i}} \alpha_{\mathrm{i} 1}, \ldots \ldots, \mathrm{~N}_{\mathrm{i}}{ }^{\mathrm{k}_{\mathrm{i} 1}-1} \alpha_{\mathrm{i} 1}\right\}$ of $\mathrm{k}_{\mathrm{i} 1}$ independent vectors span $\mathrm{Z}\left(\alpha_{\mathrm{i} 1}, \mathrm{~N}_{\mathrm{i}}\right)$. As $k_{i 1}+k_{i 2}+\cdots+k_{i R_{i}}=d_{i}$, Thus union of such $R_{i}$ basis form a basis of $W_{i}$ and union of such basis of $W_{i}$ form a basis of $V_{n}$ andunder such basis $T$ is represented in the simplest way.
Now,
$N_{i}^{k_{i 1}-1} \alpha_{i 1}=\xi_{i 1} \Rightarrow\left(T-\lambda_{i} I\right)^{k_{i 1}-1} \alpha_{i 1}=\xi_{i 1}$
$N_{\mathrm{i}}^{\mathrm{k}_{\mathrm{i} 1}} \alpha_{\mathrm{i} 1}=\left(\mathrm{T}-\lambda_{\mathrm{i}} \mathrm{I}\right) \xi_{\mathrm{i} 1}=0 \Rightarrow \mathrm{~T} \xi_{\mathrm{i} 1}=\lambda_{\mathrm{i}} \xi_{\mathrm{i} 1}$
Taken, $\alpha_{i 1}=\alpha_{i 1}^{(1)}, N_{i} \alpha_{i 1}=\alpha_{i 1}^{(2)}, N_{i}^{2} \alpha_{i 1}=\alpha_{i 1}^{(3)}, \ldots ., N_{i}^{k_{i 1}-1} \alpha_{i 1}=\alpha_{i 1}^{\left(k_{i 1}\right)}=\xi_{i 1}$
$\therefore \mathrm{T}_{\mathrm{i} 1}^{\left(\mathrm{k}_{\mathrm{i} 1}\right)}=\lambda_{\mathrm{i}} \alpha_{\mathrm{i} 11}^{\left(\mathrm{k}_{\mathrm{i} 1}\right)}$,
$\therefore \mathrm{N}_{\mathrm{i}} \alpha_{\mathrm{i} 1}^{\left(\mathrm{k}_{11}-1\right)}=\alpha_{\mathrm{i} 1}^{\left(\mathrm{k}_{11}\right)} \Rightarrow\left(\mathrm{T}-\lambda_{\mathrm{i}} \mathrm{I}\right) \alpha_{\mathrm{i} 1}^{\left(\mathrm{k}_{\mathrm{i} 1}-1\right)}=\alpha_{\mathrm{i} 11}^{\left(\mathrm{k}_{11}\right)} \Rightarrow \mathrm{T} \alpha_{\mathrm{i} 1}^{\left(\mathrm{k}_{\mathrm{i} 1}-1\right)}=\lambda_{\mathrm{i}} \alpha_{\mathrm{i} 1}^{\left(\mathrm{k}_{\mathrm{i} 1}-1\right)}+\alpha_{\mathrm{i} 1}^{\left(\mathrm{k}_{\mathrm{i} 1}\right)}$,
$\therefore \mathrm{N}_{\mathrm{i}} \alpha_{\mathrm{i} 1}^{\left(\mathrm{k}_{\mathrm{i} 1}-2\right)}=\alpha_{\mathrm{i} 1}^{\left(\mathrm{k}_{\mathrm{i} 1}-1\right)} \Rightarrow\left(\mathrm{T}-\lambda_{\mathrm{i}} \mathrm{I}\right) \alpha_{\mathrm{i} 11}^{\left(\mathrm{k}_{11}-2\right)}=\alpha_{\mathrm{i} 11}^{\left(\mathrm{k}_{\mathrm{i} 1}-1\right)} \Rightarrow \mathrm{T} \alpha_{\mathrm{i} 1}^{\left(\mathrm{k}_{\mathrm{i} 1}-2\right)}=\lambda_{\mathrm{i}} \alpha_{\mathrm{i1}}^{\left(\mathrm{k}_{\mathrm{i} 1}-2\right)}+\alpha_{\mathrm{i} 11}^{\left(\mathrm{k}_{\mathrm{i} 1}-1\right)}$,
$\therefore \mathrm{N}_{\mathrm{i}} \alpha_{\mathrm{i} 1}^{(2)}=\alpha_{\mathrm{i} 1}^{(3)} \Rightarrow\left(\mathrm{T}-\lambda_{\mathrm{i}} \mathrm{I}\right) \alpha_{\mathrm{i} 1}^{(2)}=\alpha_{\mathrm{i} 1}^{(3)} \Rightarrow \mathrm{T} \alpha_{\mathrm{i} 1}^{(2)}=\lambda_{\mathrm{i}} \alpha_{\mathrm{i} 1}^{(2)}+\alpha_{\mathrm{i} 1}^{(3)}$,
$\therefore \mathrm{N}_{\mathrm{i}} \alpha_{\mathrm{i} 1}^{(1)}=\alpha_{\mathrm{i} 1}^{(2)} \Rightarrow\left(\mathrm{T}-\lambda_{\mathrm{i}} \mathrm{I}\right) \alpha_{\mathrm{i} 1}^{(1)}=\alpha_{\mathrm{i} 1}^{(2)} \Rightarrow \mathrm{T} \alpha_{\mathrm{i} 1}^{(1)}=\lambda_{\mathrm{i}} \alpha_{\mathrm{i} 1}^{(1)}+\alpha_{\mathrm{i} 1}^{(2)}$,

Thus w.r.t the basis $B_{i 1}=\left\{\alpha_{i 1}{ }^{(1)}, \alpha_{i 1}{ }^{(2)}, \ldots \ldots, \alpha_{i 1}{ }^{\left(k_{i 1}\right)}\right\}$ matrix representation of $Z\left(\alpha_{i 1}, N_{i}\right)$ will be

$$
J_{1}^{i}=\left(\begin{array}{cccccc}
\lambda_{i} & \mathrm{O} & \cdot & \cdot & \cdot & \mathrm{O} \\
1 & \lambda_{i} & \mathrm{O} & \cdot & \cdot & \mathrm{O} \\
\mathrm{O} & 1 & \lambda_{i} & \cdot & \cdot & \cdot \\
\cdot & \mathrm{O} & 1 & \cdot & \cdot & \cdot \\
\cdot & \cdot & \cdot & \cdot & \cdot & \cdot \\
\mathrm{O} & \mathrm{O} & \cdot & \cdot & \cdot & \lambda_{i}
\end{array}\right)
$$

which is elementary Jordan matrix with charateristic value $\lambda_{i}$.
Thus w.r.t the basis $B_{i}=\left\{B_{i 1}, B_{i 2}, \ldots \ldots, B_{i R_{i}}\right\}$ of $W_{i}$ whose dimension is $d_{i}$, matrix representation of $T_{i}$ will be

$$
A_{i}=\left(\begin{array}{ccccc}
J_{1}^{i} & \mathrm{O} & \cdot & \cdot & \mathrm{O} \\
\mathrm{O} & J_{2}^{i} & \cdot & \cdot & \mathrm{O} \\
\cdot & \cdot & \cdot & \cdot & \cdot \\
\cdot & \cdot & \cdot & \cdot & \cdot \\
\mathrm{O} & \mathrm{O} & \cdot & \cdot & J_{R_{i}}^{i}
\end{array}\right)
$$

Finanally matrix representation of w.r.t. the basis $B=\left\{B_{1}, B_{2}, \ldots \ldots, B_{k}\right\}$ of $V_{n}$ will be

$$
A=\left(\begin{array}{ccccc}
A_{1} & \mathrm{O} & \cdot & \cdot & \mathrm{O} \\
\mathrm{O} & A_{2} & \cdot & \cdot & \mathrm{O} \\
\cdot & \cdot & \cdot & \cdot & \cdot \\
\cdot & \cdot & \cdot & \cdot & \cdot \\
\mathrm{O} & \mathrm{O} & \cdot & \cdot & A_{k}
\end{array}\right)
$$

which is the Jordan canonical form that is similar to every matrix which represents $T$ on $V_{n}$.
