# Connected Domination Polynomial of Some Graphs 

Dr.A.Vijayan ${ }^{1}$, M.Felix Nes Mabel ${ }^{2}$<br>${ }^{1}$ Department of Mathematics, NM Christian College, Marthandam, Kanyakumari District, Tamilnadu-629 165, India.<br>${ }^{2}$ Department of Mathematics, St.Xavier's Catholic College of Engineering, Chunkankadai, Kanyakumari District, Tamilnadu-629 003, India.

> Abstract: Let G be a simple connected graph. The connected domination polynomial of $G$ is defined by
> $C_{d}(G, x)=\sum_{i=\gamma_{d}(G)}^{|V(G)|} c_{d}(G, i) x^{i}$, where $\gamma_{d}(G)$ is the minimum cardinality of connected dominating set of $G$. In this paper, we find the connected dominating polynomial and roots of some general graphs.
Keywords: Connected domination number, connected dominating set, connected domination polynomial, connected dominating roots, minimum connected dominating set.

## I. Introduction

A connected dominating set of a graph $G$ is a set $D$ of vertices with two properties: (i) Any node in $D$ can reach any other node in $D$ by a path that stays entirely within $D$. That is, D induces a connected subgraph of $G$ (ii)Every vertex in $G$ either belongs to $D$ or is adjacent to a vertex in $D$. That is, $D$ is a dominating set of $G$.

A minimum connected dominating set of a graph $G$ is a connected dominating set with the smallest possible cardinality among all connected dominating sets of $G$. The connected domination number of $G$ is the number of vertices in the minimum connected dominating set. By the definition of connected domination number, $\gamma_{d}(\mathrm{G})$ is the minimum cardinality of a connected dominating set in G . For more details about domination number and its related parameters, we refer to [1] - [4].

For a detailed treatment of the domination polynomial of a graph, the reader is referred to [5], [6]. We introduce the connected domination polynomial of G, we obtain connected domination polynomial and compute its roots for some standard graphs.

## II. Introduction to Connected Domination Polynomial

### 2.1 Definition

Let $G$ be a simple connected graph. The connected domination polynomial of $G$ is defined by $C_{d}(G, x)=$ $\sum^{|V(G)|}$ $\sum_{i=\gamma_{d}(G)} \mathrm{c}_{\mathrm{d}}(\mathrm{G}, \mathrm{i}) \mathrm{x}^{\mathrm{i}}$, where $\gamma_{d}(\mathrm{G}) \square$ is the connected domination number of G .

### 2.2 Theorem

Let G be a graph with $|\mathrm{V}(\mathrm{G})|=\mathrm{n}$. Then
(i) If G is connected then $\mathrm{C}_{\mathrm{d}}(\mathrm{G}, \mathrm{n})=1$ and $\mathrm{C}_{\mathrm{d}}(\mathrm{G}, \mathrm{n}-1)=\mathrm{n}$.
(ii) $\mathrm{C}_{\mathrm{d}}(\mathrm{G}, \mathrm{i})=0$ if and only if $\mathrm{i}<\gamma_{d}(\mathrm{G})$ and $\mathrm{i}>\mathrm{n}$.
(iii) $\mathrm{C}_{\mathrm{d}}(\mathrm{G}, \mathrm{x})$ has no constant and first degree terms.
(iv) $\mathrm{C}_{\mathrm{d}}(\mathrm{G}, \mathrm{x})$ is a strictly increasing function in $[0, \infty)$.
(v) Let $G$ be a graph and $H$ be any induced subgraph of $G$. Then $\operatorname{deg}\left(\mathrm{C}_{\mathrm{d}}(\mathrm{G}, \mathrm{x})\right) \geq \operatorname{deg}\left(\mathrm{C}_{\mathrm{d}}(\mathrm{H}, \mathrm{x})\right)$.
(vi)Zero is a root of $\mathrm{C}_{\mathrm{d}}(\mathrm{G}, \mathrm{x})$ with multiplicity $\gamma_{d}(\mathrm{G})$.

## Proof:

(i) Since $G$ has $n$ vertices, there is only one way to choose all these vertices and it connected and dominates all the vertices. Therefore, $\mathrm{c}_{\mathrm{d}}(\mathrm{G}, \mathrm{n})=1$. If we delete one vertex v , the remaining $\mathrm{n}-1$ vertices are connected dominate all the vertices of G . (This is done in n ways). Therefore, $\mathrm{c}_{\mathrm{d}}(\mathrm{G}, \mathrm{n}-1)=\mathrm{n}$.
(ii) Since $\boldsymbol{C}_{d}(\mathrm{G}, \mathrm{i})=\Phi$ if $\mathrm{i}<\gamma_{d}(\mathrm{G})$ or $\boldsymbol{C}_{\boldsymbol{d}}(\mathrm{G}, \mathrm{n}+\mathrm{k})=\Phi, \mathrm{k}=1,2, \ldots$. Therefore, we have $\mathrm{c}_{\mathrm{d}}(\mathrm{G}, \mathrm{i})=0$ if $\mathrm{i}<\gamma_{d}(\mathrm{G})$ or $\mathrm{i}>\mathrm{n}$. Conversely, if $\mathrm{i}<\gamma_{d}(\mathrm{G})$ or $\mathrm{i}>\mathrm{n}, \mathrm{c}_{\mathrm{d}}(\mathrm{G}, \mathrm{i})=0$. Hence the result.
(iii) Since $\gamma_{d}(G) \geq 2$, the connected domination polynomial has no term of degree 0 and 1 . Therefore, it has no constant and first degree terms.
(iv) The proof of (iv) follows from the definition of connected domination polynomial of a graph.
(v) We have, $\operatorname{deg}\left(\mathrm{C}_{\mathrm{d}}(\mathrm{H}, \mathrm{x})\right)=$ number of vertices in $H$. Also, $\operatorname{deg}\left(\mathrm{C}_{\mathrm{d}}(\mathrm{G}, \mathrm{x})\right)=$ number of vertices in $G$. Since the number of vertices in $H \leq$ the number of vertices in $G, \operatorname{deg}\left(C_{d}(G, x)\right) \geq \operatorname{deg}\left(C_{d}(H, x)\right)$.
(vi) As $\mathrm{C}_{\mathrm{d}}(\mathrm{G}, \mathrm{x})$ has no constant term, $\mathrm{C}_{\mathrm{d}}(\mathrm{G}, \mathrm{x})=0$ implies $\mathrm{x}=0$. Hence $\mathrm{x}=0$ is the root of polynomial $\mathrm{C}_{\mathrm{d}}(\mathrm{G}, \mathrm{x})$. Also since least power of x in expansion of $\mathrm{C}_{\mathrm{d}}(\mathrm{G}, \mathrm{x})$ is $\gamma_{d}(\mathrm{G})$, multiplicity of root is $\gamma_{d}(\mathrm{G})$.

## III. Connected Domination Polynomial and Roots for Some Graphs

### 3.1Theorem

If $F_{m}$ is a friendship graph with $2 \mathrm{~m}+1$ vertices, then the connected domination polynomial of $F_{m}$ is $\mathrm{C}_{\mathrm{d}}\left(F_{m}, \mathrm{x}\right)=\mathrm{x}\left[(1+\mathrm{x})^{2 \mathrm{~m}}-1\right]$ and the connected dominating roots are 0 with multiplicity 2 and $e^{\frac{i \pi}{m}}-1$, $e^{\frac{i 2 \pi}{m}}-1, \ldots, e^{\frac{i(m-1) \pi}{m}}-1$ with multiplicity 1 .

## Proof:

Let $G$ be a friendship graph of size $2 m+1$ and $m \geq 2$. By labeling the vertices of $G$ as $v_{1}, v_{2}, \ldots, v_{2 m+1}$ where $\mathrm{v}_{1}$ is joined with all the vertices and $\left(\mathrm{v}_{2}, \mathrm{v}_{3}\right),\left(\mathrm{v}_{4}, \mathrm{v}_{5}\right), \ldots,\left(\mathrm{v}_{2 \mathrm{~m}}, \mathrm{v}_{2 \mathrm{~m}+1}\right)$ are joined itself. Clearly there are 2 m connected dominating set of size two namely $\left\{\mathrm{v}_{1}, \mathrm{v}_{2}\right\},\left\{\mathrm{v}_{1}, \mathrm{v}_{3}\right\}, \ldots,\left\{\mathrm{v}_{1}, \mathrm{v}_{2 \mathrm{~m}+1}\right\}$. Similarly for the connected dominating set of size three, we need to select the vertex $v_{1}$ and two vertices from the set of vertices $\left\{v_{2}, v_{3}, \ldots\right.$, $\left.\mathrm{v}_{2 \mathrm{~m}+1}\right\}$. That means there are $\binom{2 m}{2}$ connected dominating sets. In general, $\mathrm{c}_{\mathrm{d}}(\mathrm{G}, \mathrm{i})=\binom{2 m}{i-1}, 2 \leq \mathrm{i} \leq 2 \mathrm{n}+1$.
Hence $\mathrm{C}_{\mathrm{d}}\left(F_{m}, \mathrm{x}\right)=2 \mathrm{mx}^{2}+\binom{2 m}{2} \mathrm{x}^{3}+\ldots+\binom{2 m}{2 m} \mathrm{x}^{2 \mathrm{~m}+1}$

$$
=x\left[(1+x)^{2 \mathrm{~m}}-1\right] .
$$

Consider, $\mathrm{x}\left[(1+\mathrm{x})^{2 \mathrm{~m}}-1\right]=0$. The roots of this polynomial are 0 with multiplicity 2 and $e^{\frac{i \pi}{m}}-1, e^{\frac{i 2 \pi}{m}}-1, \ldots$, $i(m-1) \pi$
$e^{\bar{m}}-1$ with multiplicity 1.

### 3.2 Theorem

For any helm graph $H_{n}$ with $2 \mathrm{n}+1$ vertices, where $\mathrm{n} \geq 3, \mathrm{C}_{\mathrm{d}}\left(H_{n}, \mathrm{x}\right)=\mathrm{x}^{\mathrm{n}}(1+\mathrm{x})^{\mathrm{n}+1}$ and the connected dominating roots are 0 with multiplicity n and -1 with multiplicity $\mathrm{n}+1$.

## Proof:

Let $G$ be a helm graph of size $2 n+1$ vertices and $n \geq 3$. By labeling the vertices of $G$ as $v_{1}, v_{2}, \ldots, v_{2 n+1}$ and $v_{1}$ is joined with $v_{2}, v_{3}, \ldots, v_{n+1}$. Also $\left(v_{2}, v_{n+2}\right),\left(v_{3}, v_{n+3}\right), \ldots,\left(v_{n+1}, v_{2 n+1}\right)$ are joined itself. Clearly the only set $\left\{\mathrm{v}_{2}, \mathrm{v}_{3}, \ldots, \mathrm{v}_{\mathrm{n}+1}\right\}$ is connected dominating of size n . Clearly for the connected dominating set of size $\mathrm{n}+1$ we need to select $\left\{\mathrm{v}_{1}, \mathrm{v}_{2}, \ldots, \mathrm{v}_{\mathrm{n}+1}\right\},\left\{\mathrm{v}_{2}, \mathrm{v}_{3}, \ldots, \mathrm{v}_{\mathrm{n}+1}, \mathrm{v}_{\mathrm{n}+2}\right\},\left\{\mathrm{v}_{2}, \mathrm{v}_{3}, \ldots, \mathrm{v}_{\mathrm{n}+1}, \mathrm{v}_{\mathrm{n}+3}\right\}, \ldots,\left\{\mathrm{v}_{2}, \mathrm{v}_{3}, \ldots, \mathrm{v}_{\mathrm{n}+1}, \mathrm{v}_{2 \mathrm{n}+1}\right\}$. That means there are $\binom{n+1}{1}$ connected dominating sets. In general, $\mathrm{c}_{\mathrm{d}}(\mathrm{G}, \mathrm{i})=\binom{n+1}{i-n}, \mathrm{n} \leq \mathrm{i} \leq 2 \mathrm{n}+1$.
Hence $\mathrm{C}_{\mathrm{d}}\left(H_{n}, \mathrm{x}\right)=\mathrm{x}^{\mathrm{n}}+\binom{n+1}{1} \mathrm{x}^{\mathrm{n}+1}+\ldots+\binom{n+1}{n+1} \mathrm{x}^{2 \mathrm{n}+1}$

$$
=x^{n}(1+x)^{n+1}
$$

Consider, $\mathrm{x}^{\mathrm{n}}(1+\mathrm{x})^{\mathrm{n}+1}=0$. The roots of this polynomial are 0 with multiplicity n and -1 with multiplicity $\mathrm{n}+1$.

### 3.3 Theorem

For any lollipop graph $L_{m, 1}$ with $\mathrm{m}+1$ vertices, where $\mathrm{m} \geq 2, \mathrm{C}_{\mathrm{d}}\left(L_{m, 1}, \mathrm{x}\right)=\mathrm{x}\left[(1+\mathrm{x})^{\mathrm{m}}-1\right]$ and the connected dominating roots are 0 with multiplicity 2 and $e^{\frac{i 2 \pi}{m}}-1, e^{\frac{i 4 \pi}{m}}-1, \ldots, e^{\frac{i 2(m-1) \pi}{m}}-1$ with multiplicity 1 .

## Proof:

Let G be a lollipop graph of size $\mathrm{m}+1$ and $\mathrm{m} \geq 2$. By labeling the vertices of G as $\mathrm{v}_{1}, \mathrm{v}_{2}, \ldots, \mathrm{v}_{\mathrm{m}+1}$ where $\mathrm{v}_{\mathrm{m}+1}$ is joined only with $\mathrm{v}_{1}$ and the remaining vertices are joined with each other except $\mathrm{v}_{\mathrm{m}+1}$. Clearly there are m connected dominating set of size two namely $\left\{\mathrm{v}_{1}, \mathrm{v}_{2}\right\},\left\{\mathrm{v}_{1}, \mathrm{v}_{3}\right\}, \ldots,\left\{\mathrm{v}_{1}, \mathrm{v}_{\mathrm{m}+1}\right\}$. Similarly for the connected dominating set of size three, we need to select the vertex $v_{1}$ and two vertices from the set of vertices $\left\{v_{2}, v_{3}, \ldots\right.$, $\left.\mathrm{v}_{\mathrm{m}+1}\right\}$. That means there are $\binom{m}{2}$ connected dominating sets. In general, $\mathrm{c}_{\mathrm{d}}(\mathrm{G}, \mathrm{i})=\binom{m}{i-1}, 2 \leq \mathrm{i} \leq \mathrm{m}+1$.
Hence $\mathrm{C}_{\mathrm{d}}\left(L_{m, 1}, \mathrm{x}\right)=\mathrm{mx}^{2}+\binom{m}{2} \mathrm{x}^{3}+\ldots+\binom{m}{m} \mathrm{x}^{\mathrm{m}+1}$

$$
=\mathrm{x}\left[(1+\mathrm{x})^{\mathrm{m}}-1\right] .
$$

Consider, $\mathrm{x}\left[(1+\mathrm{x})^{\mathrm{m}}-1\right]=0$. The roots of this polynomial are 0 with multiplicity 2 and $e^{\frac{i 2 \pi}{m}}-1, e^{\frac{i 4 \pi}{m}}-1$ $, \ldots, e^{\frac{i 2(m-1) \pi}{m}}-1$ with multiplicity 1 .

### 3.4 Theorem

For any barbell graph $B_{n}$ with 2 n vertices where $\mathrm{n} \geq 3, \mathrm{C}_{\mathrm{d}}\left(B_{n}, \mathrm{x}\right)=\mathrm{x}^{2}(1+\mathrm{x})^{2(\mathrm{n}-1)}$ and the connected dominating roots are 0 with multiplicity 2 and -1 with multiplicity $2(\mathrm{n}-1)$.

## Proof:

Let $G$ be a barbell graph of size $2 n$ and $n \geq 3$. By labeling the vertices of $G$ as $v_{1}, v_{2}, \ldots, v_{n}, v_{n+1}, \ldots$ , $\mathrm{v}_{2 \mathrm{n}}$, and $\mathrm{v}_{\mathrm{n}}$ is joined with $\mathrm{v}_{\mathrm{n}+1}$. Also $\mathrm{v}_{1}, \mathrm{v}_{2}, \ldots, \mathrm{v}_{\mathrm{n}}$ are joined with each other and $\mathrm{v}_{\mathrm{n}+1}, \mathrm{v}_{\mathrm{n}+2}, \ldots, \mathrm{v}_{2 \mathrm{n}}$ are joined with each other. Clearly the only set $\left(\mathrm{v}_{\mathrm{n}}, \mathrm{v}_{\mathrm{n}+1}\right)$ is connected dominating of size 2 . Clearly for the connected dominating sets of size 3 , we need to select the vertices $v_{n}, v_{n+1}$ and one vertex from the set $\left\{v_{1}, v_{2}, \ldots, v_{n-1}\right.$, $\left.\mathrm{v}_{\mathrm{n}+2}, \ldots, \mathrm{v}_{2 \mathrm{n}}\right\}$. That means there are $\binom{2 n-2}{2}$ connected dominating sets. In general, $\mathrm{c}_{\mathrm{d}}(\mathrm{G}, \mathrm{i})=\binom{2 n-2}{i-2}, 2 \leq$ $\mathrm{i} \leq 2 \mathrm{n}$.
Hence $\begin{aligned} \mathrm{C}_{\mathrm{d}}\left(B_{n}, \mathrm{x}\right) & =\mathrm{x}^{2}+\binom{2 n-2}{1} \mathrm{x}^{3}+\binom{2 n-2}{2} \mathrm{x}^{4}+\ldots+\binom{2 n-2}{2 n-2} \mathrm{x}^{2 \mathrm{n}} \\ & =\mathrm{x}^{2}(1+\mathrm{x})^{2(\mathrm{n}-1)} .\end{aligned}$

$$
=x^{2}(1+x)^{2(n-1)} .
$$

Consider, $\mathrm{x}^{2}(1+\mathrm{x})^{2(\mathrm{n}-1)}=0$. The roots of this polynomial are 0 with multiplicity 2 and -1 with multiplicity $2(\mathrm{n}-$ $1)$.

### 3.5 Theorem

For any tadpole graph $T_{n, 1}$ with $\mathrm{n}+1$ vertices, where $\mathrm{n} \geq 4, \mathrm{C}_{\mathrm{d}}\left(T_{n, 1}, \mathrm{x}\right)=(\mathrm{n}-2) \mathrm{x}^{\mathrm{n}-2}+(2 \mathrm{n}-3) \mathrm{x}^{\mathrm{n}-1}+\mathrm{n} \mathrm{x}^{\mathrm{n}}+$ $\mathrm{x}^{\mathrm{n}+1}$ and the connected dominating roots are 0 with multiplicity $\mathrm{n}-2$ and -1 with multiplicity 2 and $-\mathrm{n}+2$ with multiplicity 1.

## Proof:

Let $G$ be a tadpole graph with $n+1$ vertices and $n \geq 4$. By labeling the vertices of $G$ as $v_{1}, v_{2}, \ldots, v_{n}$, $\mathrm{v}_{\mathrm{n}+1}$. The first n vertices are a cycle $\mathrm{C}_{\mathrm{n}}$ and $\mathrm{v}_{\mathrm{n}+1}$ is connected with the vertex $\mathrm{v}_{\mathrm{n}}$. Clearly the set $\left\{\mathrm{v}_{1}, \mathrm{v}_{2}, \ldots, \mathrm{v}_{\mathrm{n}+1}\right\}$ is a connected dominating set of cardinality $n+1$. We remove one vertex from $C_{n}$ we get the connected dominating number of cardinality n is n . That is $\mathrm{c}_{\mathrm{d}}\left(T_{n, 1}, \mathrm{i}\right)=\mathrm{n}$. Also connected dominating number with cardinality $\mathrm{n}-1$ is $2 \mathrm{n}-3$ and connected dominating number with cardinality $\mathrm{n}-2$ is $\mathrm{n}-2$. Therefore, $\mathrm{C}_{\mathrm{d}}\left(T_{n, 1}\right.$ ,x) $=(n-2) x^{n-2}+(2 n-3) x^{n-1}+n x^{n}+x^{n+1}$. Consider, $(n-2) x^{n-2}+(2 n-3) x^{n-1}+n x^{n}+x^{n+1}=0$
$\Rightarrow \mathrm{x}^{\mathrm{n}-2}\left[\mathrm{x}^{3}+\mathrm{n} \mathrm{x}^{2}+(2 \mathrm{n}-3) \mathrm{x}+\mathrm{n}-2\right]=0$
$\Rightarrow \mathrm{x}^{\mathrm{n}-2}(\mathrm{x}+1)(\mathrm{x}+1)(\mathrm{x}+\mathrm{n}-2)=0$.
Hence the roots of this polynomial are 0 with multiplicity $n-2$ and -1 with multiplicity 2 and $-n+2$ with multiplicity 1 .

## IV. Conclusion

In this paper the connected domination polynomial for some standard graphs by identifying its connected dominating sets. It also helps us to find the roots of those polynomials.
