#### Abstract

LinearOperators on invariant spaces and between Banach spaces we define a semi norm vanishing on the subspace of operators having the alternate signs Banach-Saks property. In particular, the estimates show that the alternate signsinvariant spaces and Banach-Saks property are inherited from a space of an interpolation pair $\left(A_{0}, A_{1}\right)$ tothe real interpolation spaces $A_{\theta, p}$. Finally, examples are given to support our results.

Keywords: invariant spaces ,Banach-Saks, Lions-Peetre

## I. Introduction

A linear transformation $T: V \rightarrow V$ and $\leq V . \mathrm{T}$ is invariant under T if $\mathrm{TW} \subset \mathrm{W}$ and a bounded linear operator $T: V \rightarrow W$ acting between Banach spaces is said to have the Banach-Saks (BS) property if every bounded sequence $\left(v_{n}\right)$ in $V$ contains a subsequence $\left(v_{n}^{\prime}\right)$ such that the Cesáro means of $\left(T v_{n}^{\prime}\right)$ converge in $Y$. If we restrict this definition to all weakly null sequences $\left(v_{n}\right)$ in $X$, we say that $T$ has the weak Banach-Saks (WBS) property or the Banach-Saks-Rosenthal property. We say that $T$ has the alternate signs Banach-Saks (ABS) property if every bounded sequence $\left(v_{n}\right)$ in $V$ contains a subsequence ( $v_{n}^{\prime}$ ) such that the Cesáro means of $\left((-1)^{n} T v_{n}^{\prime}\right)$ converge in $Y$.

A Banach space $V$ is called to have the BS, WBS or ABS property if the corresponding property is possessed by the identity operator $I: V \rightarrow V$. For a detailed study of these properties we refer the reader to [11].

A natural question is the behavior ofinvariant spaces andBanach-Saks properties under interpolation. Beauzamy [11] proved that if $\left(A_{0}, A_{1}\right)$ is an interpolation pair such that $A_{0}$ is continuously embedded in $A_{1}$ and the embedding has the ABS property, then the real interpolation spaces $A_{\theta, p}$ with respect to $\left(A_{0}, A_{1}\right)$ have the ABS property for all $0<\theta<1$ and $1<p<\infty$. This in turn served to show that every operator withthe BS or ABS property factors through a space with the same property (see also [13]). Heinrich [3] proved that if the embedding $I: A_{0} \cap A_{1} \rightarrow A_{0}+A_{1}$ has the BS property, then so has $A_{\theta, p}$ with respect to $\left(A_{0}, A_{1}\right)$ for all $0<\theta<1$ and $1<p<\infty$ (see also [1,12]). We find a measure of deviation from the ABS property with good interpolation properties.

Our work is motivated by[2,9, 11,14], where similar results for a measure of weak noncompactness were obtained.

## II. Invariant spaces and Banach-Saks property and spreading models

One of the basic results on invariant spacesBanach-Saks properties is the following one of Rosenthal [8]: if a Banach space $X$ does not have the WBS property, then there exist a number $\delta>0$ and a bounded double sequence $\left(v \begin{array}{l}m \\ n\end{array}\right)$ in $V$ such that for all $k \in \mathbb{N}$, all subsets $A \subset \mathbb{N}$ with $|A|=2^{k}$ and $k \leq \min A$, and all sequences of scalars $\left(c_{n}\right)$, we have

$$
\left\|\sum_{m, n \in A} c_{n} v{\underset{n}{n}}_{n}\right\| \geq \delta \sum_{n \in A}\left|c_{n}\right| .
$$

Definition 1. Let $\left(\begin{array}{ll}v & m\end{array}\right)$ be a bounded sequence in a Banach space $V$. Define

$$
\phi_{v s m}\left(v \begin{array}{c}
v \\
n
\end{array}\right)=\inf \left\||A|^{-1} \sum_{m, n \in A} \epsilon_{n} v \begin{array}{r}
m \\
n
\end{array}\right\|, \phi_{a m}\left(v \begin{array}{ll}
v & m
\end{array}\right)=\inf \left\||A|^{-1} \sum_{m, n \in A} v \underset{n}{m}\right\|,
$$

the infimum for $\phi_{v s m}\left(v{ }_{n}^{m}\right)$ being taken over all finite subsets $A \subset \mathbb{N}$ and all sequences of
$\operatorname{signs}\left(\epsilon_{n}\right)$, the infimum for $\varphi$ ambeing taken over all finite subsets $A \subset \mathbb{N}$. If $\left(w_{n}^{m}\right)$ is a sequence of svsm for $\left(v \begin{array}{c}m \\ n\end{array}\right)$, in particular, $\left(\begin{array}{ll}w & m \\ n\end{array}\right)$ is double a subsequence of $\left(v \begin{array}{c}m \\ n\end{array}\right)$ or $\binom{w}{n}$ is double a sequence of sam for $\left(v_{n}\right)$, then $\phi_{v s m}\left(\begin{array}{ll}v & m \\ n\end{array}\right) \leq \phi_{v s m}\left(\begin{array}{ll}w & m \\ n\end{array}\right)$.
Definition $2 T: V \rightarrow V$ and $W \leq V . T$ is invariant under $T$ if $\mathrm{TW} \subset \mathrm{W}$.
Note that $g(T) W \subset W$ for any polynomial $g$.
Proposition 3. suppose $\left(v \begin{array}{l}m \\ n\end{array}\right)$ be double a bounded sequence in a Banach space $X$. There exist double a subsequence $\left(v \begin{array}{c}\prime m\end{array}\right) \quad$ of $\left(v{ }_{n}^{m}\right)$ and a seminorm $L$ in the set $S$ of all finite sequences of scalars (real or complex), with the following property: for every $\epsilon>$ and every $a=\left(a_{1}, \ldots, a_{m}\right) \in S$ there exists $v \in$ Nsuch that, if $v \leq n_{1}<\ldots<n_{m}$, then

$$
\left|\left\|\sum_{i=1}^{m} a_{i} v_{n i}^{\prime m}\right\|-L(a)\right|<\varepsilon .
$$

If $\left(\begin{array}{ll}v & m \\ n\end{array}\right)$ has no Cauchy subsequence, the formula

$$
\left\|a_{1} v_{1}^{\prime 1}+\ldots+a_{m} v_{m}^{\prime m}\right\|_{E}=L(a), \quad a=\left(a_{1}, \ldots, a_{m}\right),
$$

defines a norm in the space spanned by vectors $v{ }_{m}^{\prime}$. Let $E$ bethe completion of span $\left\{v{ }_{n}^{\prime m}\right\}$ under this norm. The space $E$ is called the spreadingmodel of $V$ built on $\left(v \begin{array}{c}m \\ n\end{array}\right)$. The sequence $\left(v{ }_{n}^{m}\right)$ is called the fundamental sequence of $E$.The norm of $E$ is invariant under spreading; that is $\left\|a_{1} v_{1}^{\prime 1}+\ldots+a_{m} v_{m}^{\prime m}\right\|_{E}=\| a_{1} v_{n_{1}^{\prime}}^{\prime 1}+\ldots+$ amvnm'mEfor all
$n_{1}<\ldots<n_{m}$.
The next proposition will play a key role in our considerations. Its assertion is related to property ( $P_{1}^{\prime}$ ) of [11 ,15]. In the proof, we follow the main line of the proof of Theorem II. 2 of [11].
Proposition 4. Let $\binom{v}{n}$ be double a bounded sequence in a Banach space X. Then for every $\epsilon>0$ there exist a sequence $\left(\begin{array}{ll}w & m \\ n\end{array}\right)$ of $\operatorname{svsm}$ for $\left(v v_{n}^{m}\right)$ and a $\operatorname{sequence}\left(v \begin{array}{l}m \\ n\end{array}\right)$ of $\operatorname{sam} \operatorname{for}\left(v \begin{array}{l}m \\ n\end{array}\right)$ such that for all finite subsets $A \subset \mathbb{N}$ and all sequences of $\operatorname{signs}\left(\epsilon_{n}\right)$,

$$
\left\||A|^{-1} \sum_{m, n \in A} \epsilon_{n} w \begin{array}{c}
m \\
n
\end{array}\right\| \leq \phi_{v s m}\left(\begin{array}{ll}
w & m \\
n
\end{array}\right)+\epsilon,\left\||A|^{-1} \sum_{m, n \in A} v{\underset{n}{m}}_{n}^{m}\right\| \leq \phi_{a m}\left(\begin{array}{ll}
v & m \\
n
\end{array}\right)+\epsilon
$$

Proof.We prove the assertion for the relation svsm. The proof for the relation sam is almost the same. Fix $\varepsilon>0$. First assume that $\left(v_{n}\right)$ contains a Cauchy subsequence $\left(v_{n}^{\prime m}\right)$.Letw ${ }_{n}^{m}=\frac{v_{2 n}^{\prime}-v_{2 n-1}^{\prime m}}{2}$. Ignoring a finite number of terms of $\left(\begin{array}{ll}w & m \\ n\end{array}\right)$, we see that $\left(\begin{array}{ll}w & m \\ n\end{array}\right)$ satisfies the assertion.Now assume that $\left(\begin{array}{ll}v & m \\ n\end{array}\right)$ has no Cauchy subsequence. Let a double subsequence $\left(v_{n}^{\prime m}\right)$ of $\left(v_{n}^{m} \begin{array}{l}m\end{array}\right)$ be the fundamental sequence of the spreading model Ebuilt on $\left(v \begin{array}{c}m \\ n\end{array}\right)$, givenby Proposition 3. Taking $\left(v_{n}^{\prime m}\right)$ in the norm $\|.\|_{E}$, we put $K=\phi_{v s m}\left(v_{n}^{\prime}\right)$. Thereexists $u=m^{-1} \sum_{i=1}^{m} \epsilon_{i}^{\prime} v_{n_{i}}^{\prime m}$, where $n_{1}<\ldots<n_{m}$ and $\epsilon_{1}^{\prime}, \ldots, \epsilon_{m}^{\prime}$ is a finite sequenceof signs, such that $K \leq\|u\|_{E} \leq$ $K+\frac{\varepsilon}{4}$. Let $u{ }_{n}^{m}=m^{-1} \sum_{i=1}^{m} \epsilon_{i}^{\prime} v_{(n-1) m+i}^{\prime m}$ for every $n \in \mathbb{N}$.Since $\|.\|_{E}$ is invariant under spreading,
$K \leq\left\|u{ }_{n}^{m}\right\|_{E} \leq K+\varepsilon / 4$. Clearly,
for all finite subsets $A \subset \mathbb{N}$ and all sequences of signs $\left(\epsilon_{n}\right)$,

$$
K \leq\left\||A|^{-1} \sum_{n \in A} \epsilon_{n} u \underset{n}{m}\right\|_{E} \leq K+\varepsilon / 4 .
$$

Let $k \in N$.By Proposition 3, we get $n_{k}$ such that if $B \subset \mathbb{N}$ with $|B| \leq 2^{k}$ and $n_{k} \leq \min B$, then for all sequences of signs ( $\epsilon_{n}$ ),

$$
\left\||B|^{-1} \sum_{n \in B} \epsilon_{n} v \begin{array}{r}
m \\
n
\end{array}\right\|-\||B|^{-1} \sum_{m, n \in B} \epsilon_{n} v{\underset{n}{n} \|_{E}<\varepsilon / 4 . .4 .}
$$

We may assume that $n_{k}<n_{k+1}$ for all $k$. It follows that for the double sequence ( $u_{k}^{\prime m}$ ) with $u_{k}^{\prime m}=u_{n_{k}}^{m}$, all $B \subset \mathbb{N}$ with $|B| \leq 2^{k}$ and $k \leq \min B$, and all sequences of signs $\left(\epsilon_{n}\right)$,

$$
K-\varepsilon / 4 \leq\left\||B|^{-1} \sum_{m, n \in B} \epsilon_{n} u_{n}^{\prime m}\right\| \leq K+\varepsilon / 2
$$

Let $A \subset \mathbb{N}$ be finite and $A_{0}=\left\{n \in A: n<\log _{2}|A|\right\}$. Then

$$
\left\|\sum_{m, n \in A_{0}} \epsilon_{n} u_{k}^{\prime m}\right\| \leq\left|A_{0}\right|(K+\varepsilon / 2) \text { and }\left\|\sum_{m, n \in A \backslash A_{0}} \epsilon_{n} u_{k}^{\prime m}\right\| \geq\left|A \backslash A_{0}\right|(K-\varepsilon / 4) .
$$

Of course, we assume that the sum over the empty set is 0 .Consequently,

$$
\left\||A|^{-1} \sum_{m, n \in A} \epsilon_{n} u_{k}^{\prime m}\right\| \geq\left\||A|^{-1} \sum_{m, n \in A \backslash A_{0}} \epsilon_{n} u_{k}^{\prime m}\right\|-\left\||A|^{-1} \sum_{m, n \in A_{0}} \epsilon_{n} u_{n}^{\prime}\right\|
$$

$$
\geq K-\varepsilon / 4-\left|A_{0}\right||A|^{-1}(2 K+\varepsilon / 4)
$$

There is an $m_{0} \in \mathbb{N}$ such that if $|A| \geq m_{0}$, then $\left|A_{0}\right||A|^{-1}(2 K+\varepsilon / 4) \leq \varepsilon / 4$. Then

$$
K-\varepsilon / 2 \leq\left\||A|^{-1} \sum_{m, n \in A} \epsilon_{n} u_{k}^{\prime m}\right\| \leq K+\varepsilon / 2
$$

Let $w_{n}=m_{0}^{-1} \sum_{i=1}^{m_{0}} z_{(n-1) m_{0}+i}^{\prime}$ for every $n \in \mathbb{N}$. Then for all finite subsets $A \subset \mathbb{N}$ and all sequences of signs $\left(\epsilon_{n}\right)$,

$$
\begin{aligned}
K+\varepsilon / 2 \geq & \left\||A|^{-1} \sum_{m, n \in A} \epsilon_{n} w{ }_{n}^{m}\right\| \geq\left|\left\||A|^{-1} m_{0}^{-1} \sum_{m, n \in A} \sum_{i=1}^{m_{0}} \epsilon_{n} u_{(n-1) m_{0}+i}^{\prime m}\right\|\right. \\
& \geq K \frac{\varepsilon}{2}
\end{aligned}
$$

Thus
$\left\||A|^{-1} \sum_{m, n \in A} \epsilon_{n} w{ }_{n}^{m}\right\| \leq \phi_{v s m}\binom{w}{n}+\varepsilon$ for all finite subsets $A \subset \mathbb{N}$ and all sequences of signs $\left(\epsilon_{n}\right)$. Of course, $\left(w_{n}^{m}\right)$ is boublea sequence of $\operatorname{svsmfor}\left(v{ }_{n}^{m}\right)$.
Definition 5. Let $V, Y$ be Banach spaces and $T \in \mathcal{L}(V, Y)$. Define

$$
\Phi_{A B S}(T)=\sup \left\{\phi_{v s m}\left(T v{\underset{n}{m}}_{m}^{)}:\left(v{\underset{n}{m}}_{n}\right) \subset B(V)\right\}\right.
$$

Proposition 6. $\Phi_{A B S}$ is a seminorm in $\mathcal{L}(V, Y) . \Phi_{A B S}(T)=0$ if and only if $T \in A B S(V, Y)$.
Proof.Clearly, $\Phi_{A B S}(\lambda T)=|\lambda| \Phi_{A B S}(T)$ for all scalars $\lambda$. We show that for all $S, T \in \mathcal{L}(V, Y), \Phi_{A B S}(S+T) \leq$ $\Phi_{A B S}(S)+\Phi_{A B S}(T)$. Let $\varepsilon>0$ and $\left(v{ }_{n}^{m}\right) \subset B(V)$. By Proposition 4, there exists a sequence ( $v_{n}^{\prime m}$ ) of svsm for $\left(v \begin{array}{l}v \\ n\end{array}\right)$ such that for thesequence $\left(S v_{n}^{m}\right)$ of svsm for $\left(S v l_{n}^{m}\right)$,

$$
\left\||A|^{-1} \sum_{m, n \in A} \epsilon_{n} S v_{n}^{\prime m}\right\| \leq \phi_{v s m}\left(S v_{n}^{\prime m}\right)+\varepsilon
$$

for all finite subsets $A \subset \mathbb{N}$ and all sequences of signs $\left(\epsilon_{n}\right)$. Alsoby Proposition 4, we get a sequence $\left(v_{n}{ }^{\prime \prime}\right)$ of svsm for $\left(v_{n}^{\prime m}\right)$, such that for all finite subsets $A \subset \mathbb{N}$ and all sequences of $\operatorname{signs}\left(\epsilon_{n}\right)$,

$$
\left\||A|^{-1} \sum_{m, n \in A} \epsilon_{n} T v_{n}^{\prime \prime m}\right\| \leq \phi_{v s m}\left(T v{\underset{n}{n}}_{m}^{n}\right)+\varepsilon .
$$

Since the relation svsm is transitive,

$$
\begin{gathered}
\phi_{v s m}\left((S+T) v \begin{array}{c}
m \\
n
\end{array}\right) \leq \phi_{v s m}\left((S+T) v_{n}^{\prime \prime m}\right) \leq\left\||A|^{-1} \sum_{m, n \in A} \epsilon_{n}(S+T) v_{n}^{\prime \prime m}\right\| \\
\leq\left\||A|^{-1} \sum_{m, n \in A} \epsilon_{n} S v_{n}^{\prime \prime m}\right\|+\left\||A|^{-1} \sum_{m, n \in A} \epsilon_{n} T v_{n}^{\prime \prime m}\right\| \\
\leq \phi_{v s m}\left(S v_{n}^{\prime m}\right)+\phi_{v s m}\left(T v_{n}^{\prime \prime m}\right)+2 \varepsilon \leq \Phi_{A B S}(S)+\Phi_{A B S}(T)+2 \varepsilon .
\end{gathered}
$$

By an arbitrary choice of $\varepsilon>0$ and $\left(v{ }_{n}^{m}\right) \subset B(V)$, we obtain the conclusion.
$T$ has the ABS property if and only if for every bounded sequence $\left(v \begin{array}{c}m \\ n\end{array}\right)$ in $X$ there exist a subsequence $\left(v_{n}^{\prime m}\right)$ of $v_{n}$ and a sequence of signs $\left(\epsilon_{n}\right)$ such that the Cesàro means of $\left(\epsilon_{n} T v_{n}^{\prime m}\right)$ converge to 0 in $Y$. From this $T$ has the ABS property if and only if for every bounded sequence $\left(v \begin{array}{c}m \\ n\end{array}\right)$ in $V, \phi_{v s m}\left(T v{\underset{n}{m}}_{n}^{m}\right)=0$. By positive homogeneity of $\Phi_{A B S}, T$ has the ABS property if and only if $\Phi_{A B S}(T)=0$.

## III. Operators on invariant spaces and Banach-Saks property and $\boldsymbol{l}_{\boldsymbol{p}}(\boldsymbol{X})$ spaces

Let $X$ be a Banach space, $1<p<\infty$ and let $\left(e_{i}\right)$ be the unit vector basis of $l_{p}$. We denote by $l_{p}(V)$ the Banach space of all sequences
$v=(v(i))$ such that $v(i) \in V$ for every $i \in \mathbb{N}$ and

$$
\|v\|_{l_{p}(V)}=\left\|\sum_{i=1}^{\infty}\right\| v(i)\left\|_{V} e_{i}\right\|_{l_{p}}<\infty .
$$

In the sequel, we also deal with $l_{p}(V)$ of the families $(v(i))_{i \in \mathbb{Z}}$ indexed by integers. Partington [6] proved that $l_{p}(V), 1<p<\infty$, has the BS property if and only if so has $V$ (in fact, a more general setting of direct sums was used). We use similar arguments as in the proof of Theorem 3 of [6] to show the next lemma.
Lemma7. Suppose $V$ be a Banach space and $\left(v \underset{n}{m}\right.$ ) a boundeddobule sequence in $l_{p}(\mathrm{X}), 1<p<\infty$. Then for every $\varepsilon>0$ there exist $m \in \mathbb{N}$ and double a sequence $\binom{w}{n}$ of sam for $\left(v{ }_{n}^{m}\right)$ such that for all finite subsets $\mathrm{A} \subset \mathbb{N}$ and all sequences of $\operatorname{signs}\left(\epsilon_{n}\right)$,

$$
\left\|\sum_{i=m+1}^{\infty}\right\||A|^{-1} \sum_{m, n \in A} \epsilon_{n} w_{n}^{m}(i)\left\|_{V} e_{i}\right\|_{l_{p}}<\varepsilon
$$

Proof.For $v{ }_{n}^{m}=\left(v{ }_{n}^{m}(i)\right) \in l_{p}(V)$, put $t{ }_{n}^{m}=\sum_{i=1}^{\infty}\left\|v{ }_{n}^{m}(i)\right\|_{V} e_{i} \in l_{p}$. Since $l_{p}$ has the BS property, by ErdÖs-Magidor's theorem in [2], there exists a subsequence $\left(\begin{array}{l}{ }_{n}^{\prime}{ }_{n}^{m}\end{array}\right)$ of $\binom{t}{n}$ such that the Cesàro means of all subsequences of $\left(t{ }_{n}^{\prime m}\right)$ converge to the same limit $t$ in $l_{p}$. Then $\phi_{a m}\left(s_{n}^{m}-t\right)=0$ for every sequence $\left(s_{n}^{m}\right)$ of sam for $\binom{t^{\prime} m}{n}$. By Proposition 4, there exists a sequence $\left(\begin{array}{ll}s & m \\ n\end{array}\right)$ of sam for $\left(\begin{array}{l}t_{n}^{\prime} m\end{array}\right)$ such that for everyfinite subset $A \subset \mathbb{N}$,

$$
\left\|\sum_{i=1}^{\infty}\binom{m}{n}-t\right\|_{l_{p}}<\varepsilon / 2 .
$$

There exist $k_{0} \in \mathbb{N}$ and a sequence $\left(A_{n}\right)$ of finite subsets of $\mathbb{N}$ with $\max A_{n}<\min A_{n}+1$ and $\left|A_{n}\right|=k_{0}$ for all $n$ such that
 subsequence $\left(v v_{n}^{\prime m}\right)$ of $\left(v \begin{array}{l}m \\ n\end{array}\right)$ such that
$t_{n}^{\prime m}=\sum_{i=1}^{\infty}\left\|v_{n}^{\prime m}(i)\right\|_{V} e_{i}$, and then we putw $w_{n}=k_{0}^{-1} \sum_{k \in A_{n}} v_{k}^{\prime}$.
Let $t=\sum_{i=1}^{\infty} \alpha_{i} e_{i}$ and let $m \in \mathbb{N}$ satisfy $\left\|\sum_{i=m+1}^{\infty} \alpha_{i} e_{i}\right\|_{l_{p}}<\varepsilon / 2$. Then for every finite subset $A \subset \mathbb{N}$,

$$
\left\|\sum_{i=m+1}^{\infty}\left(|A|^{-1} \sum_{n \in A} k_{0}^{-1} \sum_{k, m \in A_{n}}\left\|v_{k}^{\prime m}(i)\right\|_{V}-\alpha_{i}\right) e_{i}\right\|_{l_{p}}<\varepsilon / 2 .
$$

It follows that

$$
\left\|\sum_{i=m+1}^{\infty}\left(|A|^{-1} \sum_{n \in A} k_{0}^{-1} \sum_{k, m \in A_{n}}\left\|v_{k}^{\prime m}(i)\right\|_{V}\right) e_{i}\right\|_{l_{p}}<\varepsilon
$$

By hyperorthogonality of the basis $\left(e_{i}\right)$, for all sequences of signs $\left(\epsilon_{n}\right)$,

$$
\left\|\sum_{i=m+1}^{\infty}\right\||A|^{-1} \sum_{m, n \in A} \epsilon_{n} w{ }_{n}^{m}(i)\left\|_{V} e_{i}\right\|_{l_{p}}<\varepsilon
$$

Theorem 8. Put $V, Y$ be Banach spaces and $1<p<\infty$. If
$T \in \mathcal{L}(V, Y)$ andif $\tilde{T} \in \mathcal{L}\left(l_{p}(V), l_{p}(Y)\right)$ is given by $\tilde{T} v=(T v(i))$ for everyv $=(v(i))$, then $\Phi_{A B S}(T)=$ $\Phi_{A B S}(\tilde{T})$.
Proof.Since $l_{p}(V)$ contains isometric copies of $V, \Phi_{A B S}(T) \leq \Phi_{A B S}(\tilde{T})$. Fix $\varepsilon>0$. There exists $\left(v_{n}\right) \subset$ $B\left(l_{p}(V)\right)$ such that $\Phi_{A B S}(\tilde{T})-\varepsilon \leq \emptyset_{v s m}\left(\tilde{T} v_{n}\right)$. By Lemma 7, there exist $m \in \mathbb{N}$ and a sequence $\left(v_{n}^{\prime m}\right)$ of samfor $\left(v{ }_{n}^{m}\right)$ such that for the sequence $\left(\tilde{T} v_{n}^{\prime}\right)$ of sam for $\left(\tilde{T} v_{n}\right)$, and for all finite subsets $A \subset \mathbb{N}$ and all sequences of signs $\left(\epsilon_{n}\right)$,

$$
\left\|\sum_{i=m+1}^{\infty}\right\||A|^{-1} \sum_{m, n \in A} \epsilon_{n} T v_{n}^{\prime m}(i)\left\|_{V} e_{i}\right\|_{l_{p}}<\varepsilon
$$

There exists a subsequence $\left(v_{n}^{\prime m}\right)$ of $\left(v_{n}^{\prime m}\right)$ such that for each $1 \leq i \leq m$ thelimit $\beta_{i}=$ $\lim _{m, n}\left\|v{ }_{n}^{" m}(i)\right\|_{V}$ exists and $\left\|v{ }_{n}^{" m}(i)\right\|_{V}<\beta_{i}+\frac{\varepsilon}{m}$ for every $n$. Putting $v_{n}(i)=\left(\beta_{i}+\frac{\varepsilon}{m}\right)^{-1} T v{ }_{n}^{" m}(i)$, we have $\left(v{ }_{n}^{m}(i)\right) \subset T(B(V))$ for every $1 \leq i \leq m$.By Proposition 4, there exists a sequence $\left(v_{n}^{m 1}\right)$ of svsm for $\left(v_{n}^{\prime \prime}{ }^{m}\right)$ such thatfor the sequence $\left(v_{n}^{m 1}(1)\right)$ of svsm for $\left(v_{n}^{m}(1)\right)$, where $v_{n}^{1}(i)=\left(\beta_{i}+\frac{\varepsilon}{m}\right)^{-1} T v_{n}^{1}(i), 1 \leq$ $i \leq m$, we have

$$
\left\||A|^{-1} \sum_{m, n \in A} \epsilon_{n} v_{n}^{m 1}(1)\right\|_{Y} \leq \emptyset_{v s m}\left(v_{n}^{m 1}(1)\right)+\varepsilon
$$

for all finite subsets $A \subset \mathbb{N}$ and all sequences of signs $\left(\epsilon_{n}\right)$.
Proceeding in this way consecutively for $i=2, \ldots, m$, in the $k t h$ step, we obtain a sequence ( $v_{n}^{k}$ ) of svsm for $\left(v_{n}^{k-1}\right)$ such that for the sequence $\left(v_{n}^{k}(k)\right)$ of $\operatorname{svsm}$ for $\left(v_{n}^{k-1}(k)\right)$, where $v_{n}^{k}(i)=\left(\beta_{i}+\varepsilon / m\right)^{-1} T v_{n}^{k}(i), 1 \leq$ $i \leq m$, we have

$$
\left\||A|^{-1} \sum_{n \in A} \epsilon_{n} v_{n}^{k}(k)\right\|_{Y} \leq \emptyset_{v s m}\left(v_{n}^{k}(k)\right)+\varepsilon
$$

for all finite subsets $A \subset \mathbb{N}$ and all sequences of signs $\left(\epsilon_{n}\right)$. In this way, all sequences $\left(v_{n}^{m}(i)\right), 1 \leq i \leq m$, are built on the common sequence $\left(v_{n}^{m}\right)$ of svsm for $\left(v_{n}\right)$, and for all finite subsets $A \subset \mathbb{N}$ and all sequences of signs $\left(\epsilon_{n}\right)$,

$$
\left\||A|^{-1} \sum_{n \in A} \epsilon_{n} v_{n}^{m}(i)\right\|_{Y} \leq \emptyset_{v s m}\left(v_{n}^{m}(i)\right)+\varepsilon, 1 \leq i \leq m
$$

It follows that

$$
\begin{gathered}
\emptyset_{v s m}\left(\tilde{T} v_{n}\right) \leq \emptyset_{v s m}\left(\tilde{T} v_{n}^{m}\right) \leq\left\|\sum_{i=1}^{m}\right\||A|^{-1} \sum_{n \in A} \epsilon_{n} T v_{n}^{m}(i)\left\|_{Y} e_{i}\right\|_{l_{p}}+\varepsilon \\
=\left\|\sum_{i=1}^{m}\right\|\left(\beta_{i}+\varepsilon / m\right)|A|^{-1} \sum_{n \in A} \epsilon_{n} v_{n}^{m}(i)\left\|_{Y} e_{i}\right\|_{l_{p}}+\varepsilon \\
\left\|\sum_{i=1}^{m}\left|\beta_{i}+\varepsilon / m\right| e_{i}\right\|_{l_{p}} \max _{1 \leq i \leq m}\left\||A|^{-1} \sum_{n \in A} \epsilon_{n} v_{n}^{m}(i)\right\|_{Y}+\varepsilon \\
\leq\left(1+\varepsilon m^{1 / p-1}\right) \max _{1 \leq i \leq m}\left\{\emptyset_{v s m}\left(v_{n}^{m}(i)\right)+\varepsilon\right\}+\varepsilon .
\end{gathered}
$$

There exists $1 \leq j \leq m$ such that $\emptyset_{v s m}\left(v_{n}^{m}(j)\right)=\max _{1 \leq i \leq m} \emptyset_{v s m}\left(v_{n}^{m}(i)\right)$.
Since $\left(v_{n}^{m}(j)\right)$ is a sequence of svsm for $\left(v_{n}(j)\right)$, we have $\left(v_{n}^{m}(j)\right) \subset T(B(V))$ andconsequently,

$$
\Phi_{A B S}(\tilde{T})-2 \varepsilon \leq\left(1+\varepsilon m^{1 / p-1}\right)\left(\Phi_{A B S}(T)+\varepsilon\right)
$$

Letting $\varepsilon \rightarrow 0$, we get $\Phi_{A B S}(\tilde{T}) \leq \Phi_{A B S}(T)$.
Corollary 9. The space $l_{p}(V), 1<p<\infty$, has the ABS property if and only if $V$ has the ABS property.

## IV. Invariant spaces and Banach-Saks property and real interpolation

We recall briefly some basic definitions and facts concerning real interpolation. For a thorough treatment we refer to $[4,5,10]$.
If two Banach spaces $A_{0}$ and $A_{1}$ are linearly and continuously embedded in a common Hausdorff topological vector space $V$, we call $\vec{A}=\left(A_{0}, A_{1}\right)$ an interpolationpair. Then $\Delta(\vec{A})=A_{0} \cap A_{1}, \Sigma(\vec{A})=A_{0}+A_{1}$ are Banach spaces with norms

$$
\|a\|_{\Delta(\vec{A})}=\max \left\{\|a\|_{A_{0}},\|a\|_{A_{1}}\right\},\|a\|_{\Sigma(\vec{A})}=\inf \left\{\left\|a_{0}\right\|_{A_{0}}+\left\|a_{1}\right\|_{A_{1}}: a_{0}+a_{1}=a\right\} .
$$

We consider a discrete method of construction of the real interpolation spaces of Lions and Peetre [3]. For $0<\theta<1$ and $1<p<\infty$, let

$$
A_{\theta, p}=\left\{a \in \Sigma(A):\|a\|_{A_{\theta, p}}<\infty\right\},
$$

where

$$
\|a\|_{A_{\theta, p}}=\operatorname{infmax}\left\|\left(2^{i \theta} a_{0}(i)\right)\right\|_{l_{p}\left(A_{0}\right)},\left\|\left(2^{i(\theta-1)} a_{1}(i)\right)\right\|_{l_{p}\left(A_{1}\right)},
$$

the infimum being taken over all families $\left(a_{0}(i)\right) \subset A_{0}$ and $\left(a_{1}(i)\right) \subset A_{1}$ with $a_{0}(i)+a_{1}(i)=a$ for all $i \in \mathbb{Z}$. Then $\Delta(A) \subset A_{\theta, p} \subset \Sigma(A)$ with continuous embeddings. The Banach space $A_{\theta, p}$ with norm $\|.\|_{A_{\theta, p}}$
is called a real interpolation space with respect to $A=\left(A_{0}, A_{1}\right)$. If
$a \in A_{\theta, p}$, then

$$
\|a\|_{A_{\theta, p}} \leq 2^{\theta(1-\theta)}\left\|\left(2^{i \theta} a_{0}(i)\right)\right\|_{l_{p}\left(A_{0}\right)}^{1-\theta}\left\|\left(2^{i(\theta-1)} a_{1}(i)\right)\right\|_{l_{p}\left(A_{1}\right)}^{\theta}
$$

for all families $\left(a_{0}(i)\right) \subset A_{0}$ and $\left(a_{1}(i)\right) \subset A_{1}$ with $a_{0}(i)+a_{1}(i)=a$ for all $i \in \mathbb{Z}$ ( see $\left.[1,5,7]\right)$.
Let $A_{\theta, p}$ and $B_{\theta, p}$ be two interpolation spaces with respect to the interpolation pairs $\quad \vec{A}=\left(A_{0}, A_{1}\right) \quad$ and $\vec{B}=\left(B_{0}, B_{1}\right)$, and let
$T: \Sigma(\vec{A}) \rightarrow \Sigma(\vec{B})$ be a linear operator. We write $T: \vec{A} \rightarrow \vec{B}$, if for
$j=0,1$,the restriction $T \mid A_{j}$ is a bounded operator into $B_{j}$.
For every $T: \vec{A} \rightarrow \vec{B}$,

$$
\left\|T: A_{\theta, p} \rightarrow B_{\theta, p}\right\| \leq 2^{\theta(1-\theta)}\left\|T: A_{0} \rightarrow B_{0}\right\|^{1-\theta}\left\|T: A_{1} \rightarrow B_{1}\right\|^{\theta} .
$$

we show that this classical inequality concerning boundedness has its counterpart for the ABS property.
Lemma 10 Let $W$ be an invariant subspace of $V$ under $T$. Then $m T W$ divides $m T$.
If $A=\left(\begin{array}{ll}B & C \\ O & D\end{array}\right)$, then $A^{k}=\left(\begin{array}{cc}B^{k} & C_{k} \\ O & D^{k}\end{array}\right)$.
Example 11 Let $W=W_{1}, \ldots . W_{K}$ be the space generated by all eigenvectors of $T$. Then $W$ is invariant under T. Let $B^{\prime}=\left\{\alpha_{1}, \ldots, \alpha_{r}\right\}$ be the basis for $W$ and extend it to a basis $\mathcal{B}$ for $V$. Then

$$
[T]_{B}=\left(\begin{array}{ll}
B & C \\
O & D
\end{array}\right)
$$

and
$B=\left[T_{W}\right]_{B^{\prime}}=\operatorname{diag}\left(c_{1}, \ldots, c_{1}, c_{2}, \ldots, c_{2}, \ldots, c_{k}, \ldots, c_{k}\right)$.
Corollary 12. $\Phi_{\text {ABS }}$ isaseminorm in $\mathcal{L}(\mathrm{X}, \mathrm{Y}) . \Phi_{\mathrm{ABS}}(\mathrm{T})=0$ if and only if $\mathrm{T} \in \operatorname{ABS}(\mathrm{X}, \mathrm{Y})$.
Proof. Clearly, $\Phi_{\mathrm{ABS}}(\lambda \mathrm{T})=|\lambda| \Phi_{\mathrm{ABS}}(\mathrm{T})$ for all scalars $\lambda$. We show that for all $\mathrm{S}, \mathrm{T} \in \mathcal{L}(\mathrm{X}, \mathrm{Y}), \Phi_{\mathrm{ABS}}(\mathrm{S}+\mathrm{T}) \leq$ $\Phi_{\mathrm{ABS}}(\mathrm{S})+\Phi_{\mathrm{ABS}}(\mathrm{T})$. Let $\varepsilon>0$ and $\left(v_{n}+w_{n}\right) \subset B(V)$. By Proposition 4, there exists a sequence $\left(v_{n}^{\prime}+w_{n}^{\prime}\right)$ of $\operatorname{svsm}$ for $\left(v_{n}+w_{n}\right)$ such that for thesequence $\left(S\left(v_{n}^{\prime}+w_{n}^{\prime}\right)\right)$ of $\operatorname{svsm}$ for $\left(S\left(v_{n}+w_{n}\right)\right)$,

$$
\left\||A|^{-1} \sum_{n \in A} \epsilon_{n} S\left(v_{n}^{\prime}+w_{n}^{\prime}\right)\right\| \leq \phi_{v s m}\left(S\left(v_{n}^{\prime}+w_{n}^{\prime}\right)\right)+\varepsilon
$$

for all finite subsets $A \subset \mathbb{N}$ and all sequences of signs $\left(\epsilon_{n}\right)$. Again applying Proposition 4, we get a sequence $\left(v_{n}^{\prime \prime}+w_{n}^{\prime \prime}\right)$ of $\operatorname{svsm}$ for $\left(v_{n}^{\prime}+w_{n}^{\prime}\right)$, such that for all finite subsets $A \subset \mathbb{N}$ and all sequences of signs $\left(\epsilon_{n}\right)$,

$$
\left\||A|^{-1} \sum_{n \in A} \epsilon_{n} T\left(v_{n}^{\prime \prime}+w_{n}^{\prime \prime}\right)\right\| \leq \phi_{v s m}\left(T\left(v_{n}+w_{n}\right)\right)+\varepsilon
$$

Since the relation svsm is transitive,

$$
\begin{gathered}
\phi_{v s m}\left((S+T)\left(v_{n}+w_{n}\right)\right) \leq \phi_{v s m}\left((S+T)\left(v_{n}^{\prime \prime}+w_{n}^{\prime \prime}\right)\right) \leq\left\||A|^{-1} \sum_{n \in A} \epsilon_{n}(S+T)\left(v_{n}^{\prime \prime}+w^{\prime \prime}\right)_{n}\right\| \\
\leq\left\||A|^{-1} \sum_{n \in A} \epsilon_{n} S\left(v_{n}^{\prime \prime}+w_{n}^{\prime \prime}\right)\right\|+\left\||A|^{-1} \sum_{n \in A} \epsilon_{n} T\left(v_{n}^{\prime \prime}+w_{n}^{\prime \prime}\right)\right\| \\
\leq \phi_{v s m}\left(S\left(v_{n}^{\prime}+w_{n}^{\prime}\right)\right)+\phi_{v s m} T\left(v_{n}^{\prime \prime}+w_{n}^{\prime \prime}\right)+2 \varepsilon \leq \Phi_{A B S}(S)+\Phi_{A B S}(T)+2 \varepsilon .
\end{gathered}
$$

By an arbitrary choice of $\varepsilon>0$ and $\left(v_{n}+w_{n}\right) \subset B(V)$, we obtain the conclusion.
Corollary 13. Let $A_{\theta, p}$ and $B_{\theta, p}$ with $0<\theta<1$ and $\varepsilon>0$ be real interpolation spaces with respect to interpolation pairs
$\vec{A}=\left(A_{0}, A_{1}\right)$ and $\vec{B}=\left(B_{0}, B_{1}\right)$.Then for every $T: \vec{A} \rightarrow \vec{B}$,

$$
\Phi_{A B S}\left(T: A_{\theta, p} \rightarrow B_{\theta, p}\right) \leq 2^{\theta(1-\theta)} \Phi_{A B S}^{1-\theta}\left(T: A_{0} \rightarrow B_{0}\right) \Phi_{A B S}^{\theta}\left(T: A_{1} \rightarrow B_{1}\right)
$$

ProofFix $\varepsilon>0$. Let $\left(a_{n}\right)$ be a sequence in $B\left(A_{\theta, p}\right)$.For each $a_{n}$ there exist $v_{j n}=\left(2^{i(\theta-j)} a_{j n}(i)\right)_{i \in \mathbb{Z}} \in$ $B\left(l_{p}\left(A_{j}\right)\right), j=0,1$, such that $a_{0 n}(i)+a_{1 n}(i)=a_{n}$ for all $i \in \mathbb{Z}$. Set $w_{j n}=\left(2^{i(\theta-j)} T a_{j n}(i)\right)_{i \in \mathbb{Z}}$ for
$j=0,1$ and every $n \in \mathbb{N}$. As in the proof of subadditivity of $\Phi_{A B S}$, by Proposition 4 , passing to a sequence of svsm built on a common sequence of svsm for $\left(a_{n}\right)$, we may assume that for all finite subsets
$A \subset \mathbb{N}$ and all sequences of signs $\left(\epsilon_{n}\right)$,

$$
\left\||A|^{-1} \sum_{n \in A} \epsilon_{n} w_{j n}\right\|_{l_{p\left(B_{j}\right)}} \leq \emptyset_{v s m}\left(w_{j n}\right)+\varepsilon, j=0,1 .
$$

Let $\widetilde{T}_{j}: l_{p}\left(A_{j}\right) \rightarrow l_{p}\left(B_{j}\right), j=0,1$, be defined as the operator $\tilde{T}$ in Theorem 8. Then $w_{j n}=\tilde{T} v_{j n}$. It follows that

$$
\emptyset_{v s m}\left(T a_{n}\right) \leq\left\||A|^{-1} \sum_{n \in A} \epsilon_{n} T a_{n}\right\|_{B_{\theta, p}}
$$

$$
\begin{gathered}
\leq 2^{\theta(1-\theta)}\left\||A|^{-1} \sum_{n \in A} \epsilon_{n} w_{0 n}\right\|_{l_{p}\left(B_{0}\right)}^{1-\theta}\left\||A|^{-1} \sum_{n \in A} \epsilon_{n} w_{1 n}\right\|_{l_{p}\left(B_{1}\right)}^{\theta} \\
\leq 2^{\theta(1-\theta)}\left(\emptyset_{v s m}\left(w_{0 n}\right)+\varepsilon\right)^{1-\theta}\left(\emptyset_{v s m}\left(w_{0 n}\right)+\varepsilon\right)^{\theta} \\
\leq 2^{\theta(1-\theta)}\left(\Phi_{A B S}\left(\widetilde{T}_{0}\right)+\varepsilon\right)^{1-\theta}\left(\Phi_{A B S}\left(\widetilde{T}_{1}\right)+\varepsilon\right)^{\theta} .
\end{gathered}
$$

Since $l_{p}(V)$ with families indexed by integers is isometricallyisomorphic to $l_{p}(V)$ with sequences indexed by $N$, and $\varphi v s m$ is invariant under linear isometries, by Theorem $8, \Phi_{A B S}\left(\tilde{T}_{j}\right)=\Phi_{A B S}\left(T: A_{j} \rightarrow b_{j}\right), j=0,1$.
By an arbitrary choice of $\varepsilon$ and
